

The Northeast Regional Habitat Assessment:

A collaborative, multi-disciplinary project to develop decision support products for marine fish habitat management

Michelle Bachman, New England Fishery Management Council, Inshore Team Co-Lead (mbachman@nefmc.org)

Jessica Coakley, Mid-Atlantic Fishery Management Council, Coordinator, Inshore Team Co-Lead (jcoakley@mafmc.org)

Chris Haak, Monmouth University/NOAA Northeast Fisheries Science Center, Research Scientist (chaak@monmouth.edu)

Tori Kentner, Mid-Atlantic Fishery Management Council, Spatial Ecologist (tkentner@mafmc.org)

Laurel Smith, NOAA Northeast Fisheries Science Center, Offshore Team Lead (laurel.smith@noaa.gov)

Presentation to the ASMFC Habitat Committee

November 2022

Acknowledgments

The Steering Committee:

Mid-Atlantic Fishery Management Council - Christopher Moore
New England Fishery Management Council - Thomas Nies
Atlantic Coast Fish Habitat Partnership - Lisa Havel
Atlantic States Marine Fisheries Commission - Bob Beal
(designee Patrick Campfield)
Duke University, Marine Spatial Ecology - Patrick Halpin
Monmouth University, Urban Coast Institute - Tony McDonald
National Fish Habitat Partnership, Science and Data
Committee - Gary Whelan
NOAA Fisheries Offices of Habitat Conservation - Kara
Meckley, Lou Chiarella
NOAA NCCOS Marine Spatial Ecology Division - Mark Monaco
NOAA Fisheries Office of Science and Technology - Peg Brady,
Tony Marshak
NOAA Northeast Fisheries Science Center - Thomas Noji
(retired), Dan Wieczorak
The Nature Conservancy - Kate Wilke

Action Teams:

Gulf of Maine Research Institute - Kathy Mills
Maryland DNR - Marek Topolski
Massachusetts DMF - Mark Rousseau
NOAA Fisheries GARFO - David Stevenson, Alison Verkade
NOAA Fisheries NEFSC - Kevin Friedland, Donna Johnson, Ryan Morse, Dave
Packer, Vince Saba, Harvey Walsh
NOAA NCCOS - Andrew Leight
The Nature Conservancy - Bryan DeAngelis, Rich Bell, Marta Ribera
The PEW Charitable Trusts - Zack Greenberg
Rhode Island DEM - Eric Schneider

US Geologic Service - Stephen Faulkner
Virginia Institute of Marine Sciences - Robert Latour
NRHA/FSCVA/HCVA Crosswalk: UMass/SMASST Gavin Fay and Madeleine
Guyant, and Project CoPIs, Mike Johnson, Tauna Rankin, Wendy Morrison
(NOAA Fisheries)
Other Collaborators: David (Moe) Nelson (NOAA NOS), Aaron Kornbluth
(PEW), Lisa Havel and Pat Campfield (ASMFC/ACFHP), Karl Vilacoba, Emily
Shumchenia, and Nick Napoli (MARCO/NROC), Sarah Gaichas and Kim Hyde
(NOAA Fisheries NEFSC), and Emily Farr

Special thanks to the Councils and NOAA Fisheries Office of Habitat Conservation and Office of Science and Technology for the substantial support provided to NRHA. In addition, this work would not be possible without the support of our many partner organizations represented on our Steering Committee, action team members, and other collaborators.

NRHA Goal: To describe and characterize estuarine, coastal, and offshore fish habitat distribution, abundance, and quality in the Northeast.

Four actions were identified as necessary to meet this goal:

- 1) Inshore fish habitat assessment
 - a) Fish distribution and abundance
 - b) Habitat distribution, status, and trends
- 2) Habitat vulnerability including response to changes in climate,
- 3) Spatial descriptions of species habitat use in the offshore area, and,
- 4) Habitat data visualization and decision support tools.

Geographic Scope: Northeast U.S.

South to North

North Carolina/South Carolina boundary to the western end of the Scotian Shelf and includes the Mid-Atlantic Bight, Southern New England, Georges Bank, and the Gulf of Maine.

Inshore to Offshore

Mean high water including estuaries to the shelf-slope break

Focus Species (65+, important to managers)

- **Mid-Atlantic Council:** Atlantic and chub mackerel, butterfish, longfin and shortfin squid, surfclam, ocean quahog, summer flounder, scup, black sea bass, bluefish, golden and blueline tilefish, spiny dogfish
- **New England Council:** Cod, cusk, haddock, pollock, Acadian redfish, plaice, halibut, winter flounder, witch flounder, yellowtail flounder, wolffish, windowpane, ocean pout, offshore, red, and white hake, monkfish, Atlantic herring, salmon, skates (seven species), red crab, sea scallop
- **Additional Atlantic States Marine Fisheries Commission (ASMFC):** Eel, lobster, croaker, menhaden, striped bass, Atlantic sturgeon, black drum, cobia, horseshoe crab, Jonah crab, northern shrimp, red drum, shad and river herring, Spanish mackerel, spot, spotted seatrout, tautog, weakfish, coastal sharks
- **Highly migratory with Habitat Areas of Particular Concern (HAPC) designations:** Sandbar shark, dusky shark

Assessment Products at a Glance

Data inventory

- Catch data from state and federal fisheries-independent surveys; including comparison table
- Environmental datasets (used as model covariates)
- One page metadata document for each survey or data set

Habitat use

- Species profiles: Summarize life history and habitat use for each focus species
- Stage-based, single species and joint (“community”) species distribution models (SDMs)
- Inshore Habitat Report

Climate vulnerability - Species-Habitat Crosswalk

- Species-habitat matrix and climate vulnerability narratives

Habitat data visualization and decision support tools

- NRHA Data Explorer: R-Shiny application used to show trends in species distribution and abundance at state and regional scales, and to share other products and documentation
- Working with partners at Mid-Atlantic Ocean Data Portal, Northeast Ocean Data Portal, and possibly NOAA DisMAP to share selected products

Scientific publications/reports

- Community-level Basis Function Modeling methods paper and R package; others in development

Metadata (1-pagers)

usSEABED

Data Source: USCG, University of Colorado and partners

Data Type: Geomatics, Percent Cover, Mud (GSM)

Geographic Range: US Coast

Overview: usSEABED contains data from small and large marine research efforts by many military, federal and state agencies, local authorities, universities, as well as private and public consortiums.

Methodology: Data sources were compiled using the usSEABED system to combine unique datasets into a standardized database. usSEABED is a data-mining program that applies logic and filters to marine geospatial and metadata data. Metadata is stored in Oracle, but sample descriptions, photos, and videos, as well as the most important metadata, are stored in a laboratory web database using Fish and Shrimp systems. Statistical comparisons are made between lab-based and world-based data as a ground truth to improve classification. The goal is accurate classification within one percent.

Data Curation: Some small portions have been made but overall usSEABED has not been updated since 2002. Absences cannot be assumed because data is based on observation records. Additionally, much of the dataset is based on usSEABED data to classifications are estimates and not exact measurements of grain size. Lastly, due to limitations in sample processing usSEABED is a poor representing layer settlement such as corals, lobsters and bottom outcrops.

Data Access: usSEABED data is available for download and is broken into two regions: Pacific Coast, Gulf of Mexico and Caribbean and Atlantic Coast. Digital data delivery: <https://www.usseabed.org>

Lots of Reports...

Spencer Pfeiffer - Black Sea Bass (*Centropristis striata*)

Species range and distribution: Black sea bass occurs from New York and the Gulf of Fundy (St. Hubert) westward through Chesapeake Bay 1990 and into the Gulf of Mexico.

Historical abundance and habitat use (1980-2010):

Egg and larval stage larvae are pelagic, and most are abundant in water depths of 10-50 m and water temperatures of 15-24°C during June-August on the continental shelf from within 50 m of the bottom between 1970 and 1975. During 1980s egg and larval densities were generally higher than in the 1990s. High seas with high energy egg densities were generally located in continental shelf off the western off-shore waters including Chesapeake Bay, the Delaware Bay and the Hudson River. Black sea bass also occur in shallowly in bays such as Buzzards Bay, Nantuxet Bay and the Hudson River as well as Long Island Sound (O'Connor and Fife, 2002; Thresher, POC, and Korman 1995) and offshore in Narragansett Bay (Thresher and Korman 1985) and between Bay and Long Island Sound (Walt and Hare, 1980).

Walt and Hare: sea bass were collected from 1950 to 1980 on the continental shelf, but only when within estuary. Also in 1980s reported that most larvae were from three estuarine shelf habitats and that these were also estuarine reservoirs where post-larval stage juveniles can be abundant.

Young of the Year Abundance: Larvae reach 60 mm (age 1.5-2.1 mo) by mid-July and settle to the seafloor between 1970 and 1975. During 1980s young densities were generally higher than in the 1990s. Young of the year densities were generally higher than in the 1990s. Young of the year densities were generally higher than in the 1990s. Young of the year densities were generally higher than in the 1990s.

Walt and Hare: young of the year densities were generally higher than in the 1990s. Young of the year densities were generally higher than in the 1990s. Young of the year densities were generally higher than in the 1990s. Young of the year densities were generally higher than in the 1990s.

Climate Vulnerability Assessment Crosswalk

- Synthesis of information from NOAA’s FSCVA, HCVA, ACFHP species-habitat matrix, and EFH designations
- Matrix that indicates species’ dependency on (or association with) habitat types, by life stage
- Narratives that describe species and habitat climate vulnerabilities and habitat dependencies, in text and tables
- Will highlight critical/most concerning intersections of species and habitat climate vulnerability
- Products shared via NRHA Data Explorer

Atlantic Cod (New England)					
		Life Stage Dependency			
Habitat Type	HCVA Climate Vulnerability Rank	Egg/ Larvae	Juvenile/ YOY	Adult	Spawning Adult
Firm Hard Bottom	Marine intertidal rocky bottom- High (juveniles/YOY only)				
	Estuarine intertidal rocky bottom- Moderate (juveniles/YOY only)		H	H	H
	Estuarine subtidal rocky bottom- Low Marine rocky bottom <200m- Low				

Atlantic Cod (*Gadus morhua*)

Species Climate Vulnerability:

Atlantic cod is projected to be moderately vulnerable to climate change due to exposure to changing ocean temperature and acidification and sensitivity in terms of stock status (overfished with overfishing occurring), slow population growth rates, stock status, and specific early life history requirements (e.g., dependence on specific circulation patterns for larval retention and specific nursery habitats). Atlantic cod are projected to be negatively affected by climate change caused by resulting decreases in recruitment and suitable habitat (Hare et al. 2016). Temperature plays an important role in Atlantic cod recruitment, growth, and survival, and several studies have reported declines in populations in the southern extent of the range due to projected increased temperature (Drinkwater 2005; Fogarty et al. 2008; Pershing et al. 2015; Planque and Fredou 1999).

Characterizing Habitat: A comprehensive modeling strategy

- **Stage-based approach**

- Partitioning spp. into distinct classes based on ontogeny (i.e., juveniles & adults)
- Better resolution of stage-specific requirements or habitat shifts?

- **Joint-species distribution model**

- Using a novel spatiotemporal approach (CBFM) w/ comparison to GAMs
- Improved predictions & possible ecological insights?

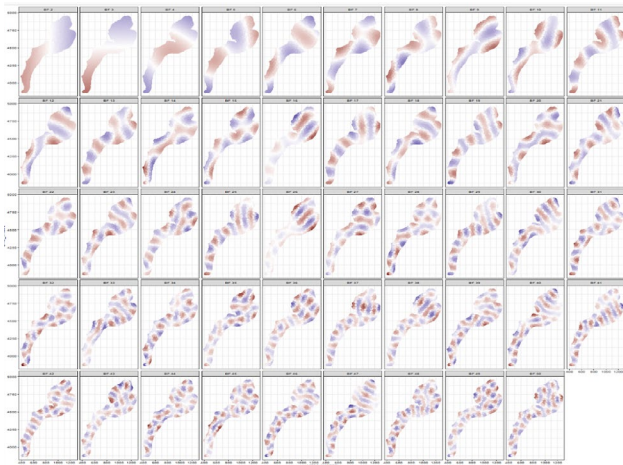

- **Dynamic & ecologically relevant covariates**

- Temporally varying predictors that reflect dynamic nature of the system
- Predictors with direct consequences for ecological function of animals

CBFM: Community-level Basis Function model

- **Related to GAMS**

- Basis functions (BF) model covariance in space & time

- **Methods Manuscript** w/ Simulation Studies
- **R package** (Github repository, June public release)

Spatio-Temporal Joint Species Distribution Modeling: A Community-Level Basis Function Approach

Francis K.C. Hui^{*1}, David I. Warton², Scott D. Foster³, Nicole A. Hill⁴, and Christopher R. Haak⁵

¹Research School of Finance, Actuarial Studies and Statistics, The Australian National University, Canberra, Australia

²School of Mathematics and Statistics, The University of New South Wales, Sydney, Australia

³Data61, Commonwealth Scientific and Industrial Research Organization, Hobart, Australia

⁴Institute for Marine and Antarctic Studies, University of Tasmania, Hobart, Australia

⁵Northeast Fisheries Science Centre, National Oceanic and Atmospheric Administration, Highlands NJ, USA

NRHA CBFM Application

- **97 spp-stages** from NMFS bottom-trawl surveys
 - Demersal, pelagic, benthic spp. (managed, common & prey)
 - Training 2000-2015 (n > 10000 obs), testing 2016-2019 (n > 2700 obs)
- Combined **Spring & Fall** surveys
- Predictors:
 - Surface & bottom **temperature** (monthly & annual min/max), **salinity** (surface & bottom), **sea surface height**, depth (or correlates of depth including **optical environment & hydrodynamic stress**), benthic habitat characteristics (topographic position, complexity & sediment type)
- **Hurdle & ZINB models** (presence/absence & count conditional on presence, or covariate-dependent zero inflation)
- Spatiotemporal Basis Functions (intra-year) & GP smooth on year

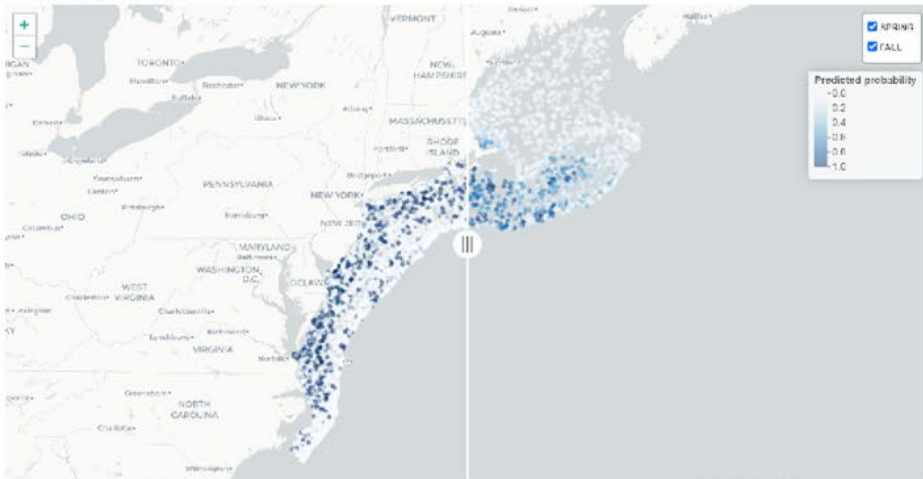

Example Predictions: Summer flounder adult (beta)

Select Species:

Summer flounder adult

Model Distribution Variance explained and significance Species correlation matrix

Map Left pane is True catch and Right pane is Predicted catch

Predictor Importance

- % variance explained by each predictor (and spatiotemporal BFs & year effect)
- What factors are most influential in driving habitat use of a spp?

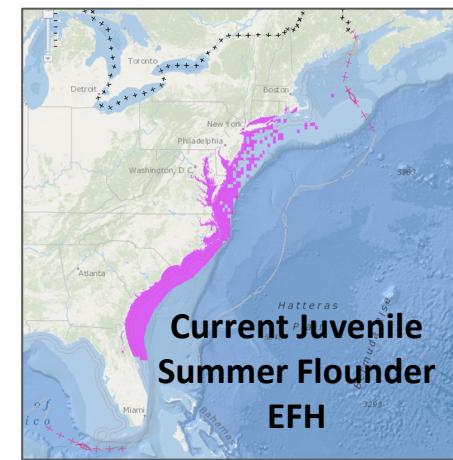

Residual (& Partial) Correlations

- Correlation b/w spp. that is **not** explained by measured predictors
- May be evidence of of:
 - **Biotic interactions?**
 - Responses to “missing” covariates?
 - **Dispersal effects**
- Partial correlations control for “indirect” interactions (e.g., shared avoidance of a predator)

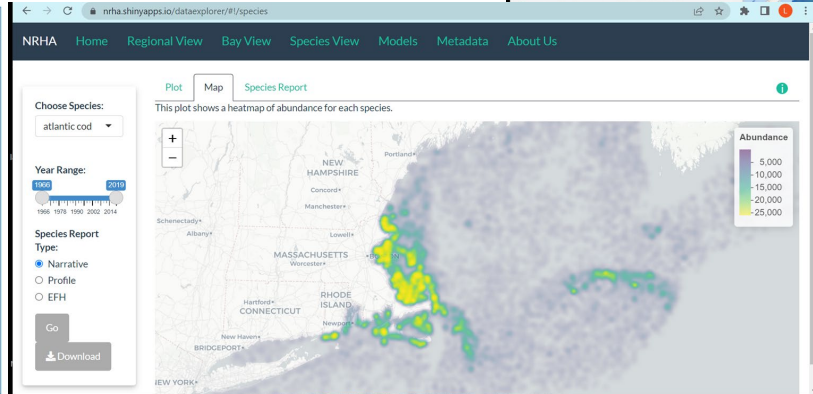

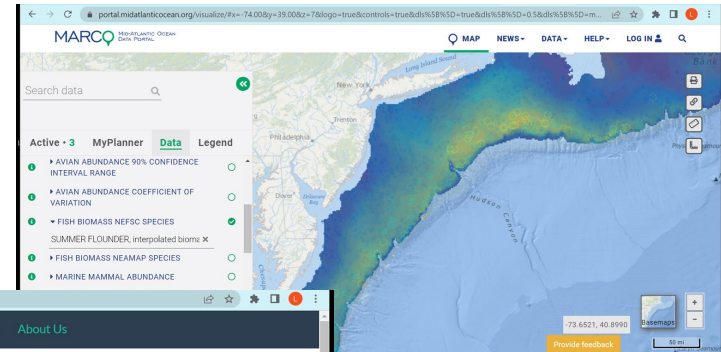

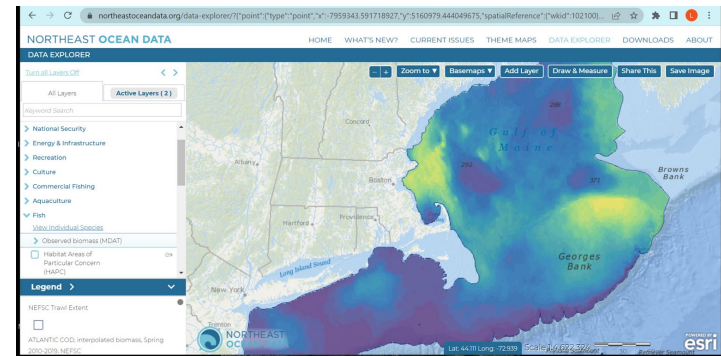

Applications for NRHA Products

- **Essential Fish Habitat:** NRHA provides more specificity on which environmental factors influence species distribution.
 - EFH text descriptions and maps
 - Habitat area of particular concern (HAPC) designations
 - Potential for shifts due to climate change and adaptive approach with automated updates
- **State of the Ecosystem Reports:** NRHA provides habitat and climate change information on managed species
- **Single Species Assessments:** Addresses Ecosystem TORs (e.g. butterflyfish 2022)
 - NRHA provides historic distributions and projected distributions due to climate change
 - Links between environmental drivers stock health and recruitment

Publicly Available Data Portals

- Intent is to make NRHA products as widely available as possible
- NRHA Data Explorer (R-Shiny) – main host, but share specific/curated products with...
 - Northeast Ocean Data Portal
 - Mid-Atlantic Ocean Data Portal (MARCO)
 - NMFS Distribution Mapping and Analysis Portal (DisMAP)

NRHA Data Explorer Demonstration

Available here: <https://nrha.shinyapps.io/dataexplorer>

NRHA Home Survey View Species View Models Habitat Crosswalk Reports About Us

Welcome to the Northeast Regional Habitat Assessment Data Explorer

Survey View

Northeast regional and inshore bay/estuary view of fishery independent survey data including top 20 species abundance and biomass, similarity clusters, and survey temperature and salinity data.

Species View

Species view of fishery independent survey data, including distributions, relative abundance, and reports on habitat use and vulnerability to climate change.

Model View

Outputs from spatiotemporal models that describe species distributions as a function of dynamic environmental factors, species interactions and predicted change in habitat use under various climate scenarios.

Habitat Crosswalk

Habitat species vulnerability matrix and species narratives for 66 managed and forage species in the region.

This application shares products from the Northeast Regional Marine Fish Habitat Assessment (NRHA) and provides tools to explore fish habitat data*, with an emphasis on habitat use at different regional scales and by diverse fish and shellfish species in the Northeast. For more info about our history and team see [About Us](#).

*Datasets displayed on this site in summary format have associated caveats related to the collection of these data and their use. Please refer to the [Reports](#) page for additional details on each dataset, including contact information to obtain the source data. NRHA did not create the data and cannot guarantee its accuracy, or its suitability for use for other applications. NRHA encourages proper use and attribution of any datasets summarized on this site. Interested parties should directly contact the data providers noted in the metadata inventory for additional details on these data and their proper use.

EAST COAST CLIMATE CHANGE SCENARIO PLANNING UPDATE

Update to Council Coordination Committee
October 18, 2022

New England
Fishery Management Council

MID-ATLANTIC FISHERY
MANAGEMENT COUNCIL

Today's Objectives

1. Update on scenario development since last CCC meeting
 - “Scenario deepening” process; overview of the 4 scenarios
2. Recent manager brainstorming sessions
3. Next Steps

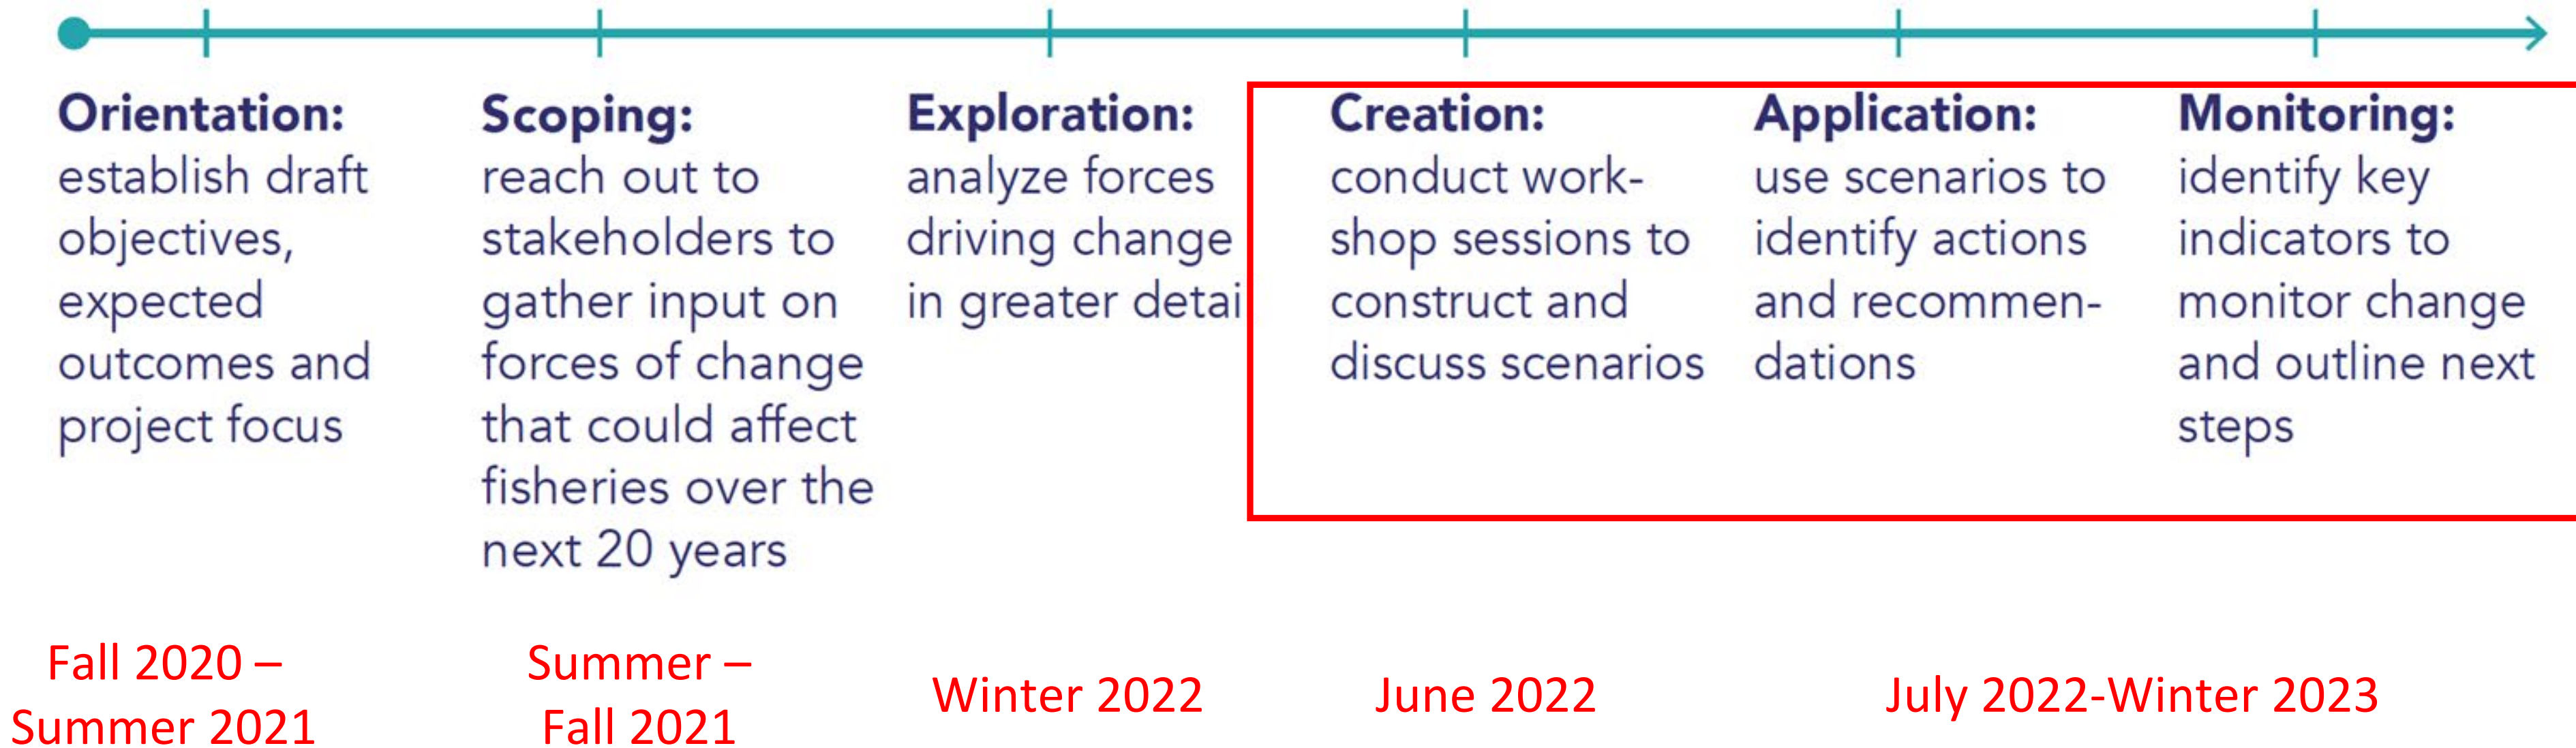

Initiative Objectives

1. Explore how **East Coast fishery governance and management issues** will be affected by climate driven change in fisheries, particularly changing stock availability and distributions.
2. **Advance a set of tools and processes** that provide flexible and robust fishery management strategies, which continue to promote fishery conservation and resilient fishing communities, and address uncertainty in an era of climate change.

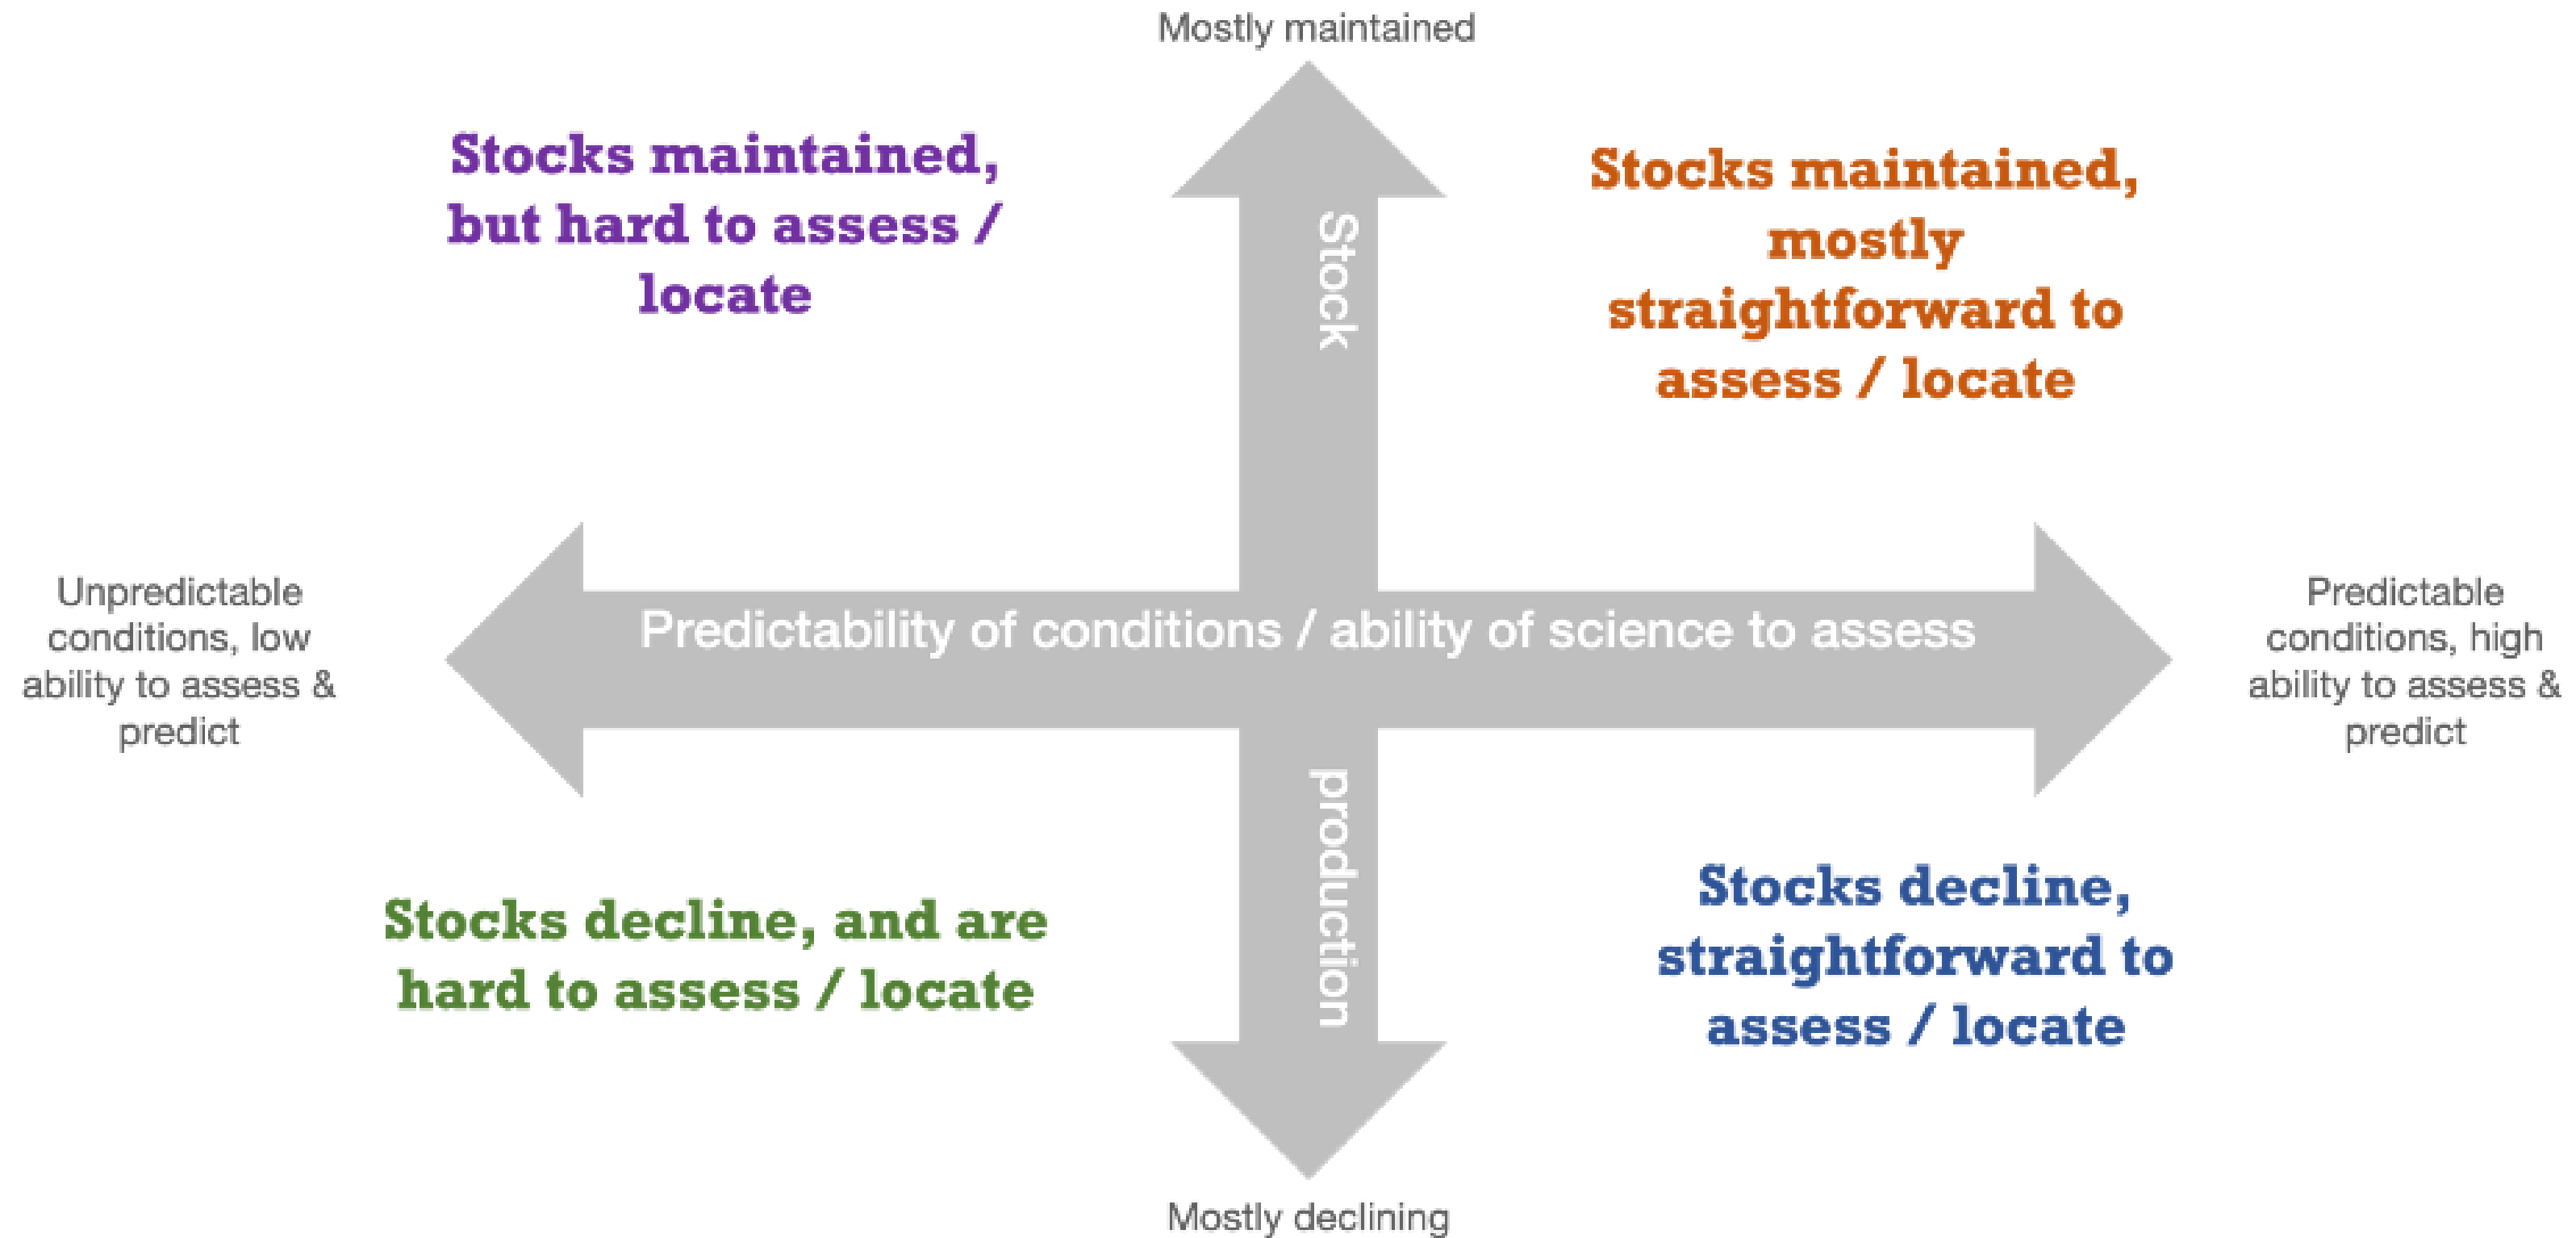

Phases: Scenario Creation, Applications, Monitoring

Steps in this Multi-Year Initiative

Scenario Framework Construction

Combining the uncertainties results in a matrix that creates four different stories of the future

Divergent scenarios, with several common features

1. Ocean temperature continue to warm, affecting marine species biology and distribution
2. Regions exhibit differences in seasonal temperature changes
3. Primary production changes differently in different regions
4. Sea levels rise
5. Changing ocean uses create more competition for fisheries
6. Coastal population grows

Adaptability matters...

Resulting Scenarios: East Coast Fisheries in 2040

Ocean Pioneers:

A 'wild west' of new ocean users, risk-taking fishery operators taking advantage of confusing, unpredictable but ultimately positive conditions.

Unpredictable changes & conditions, low ability to assess

Compound Stress Fractures:

A world with multiple sources of stress face operators and managers, where the industry fractures between some who play it smart, and others who lose out.

Mostly maintained

Checks & Balance:

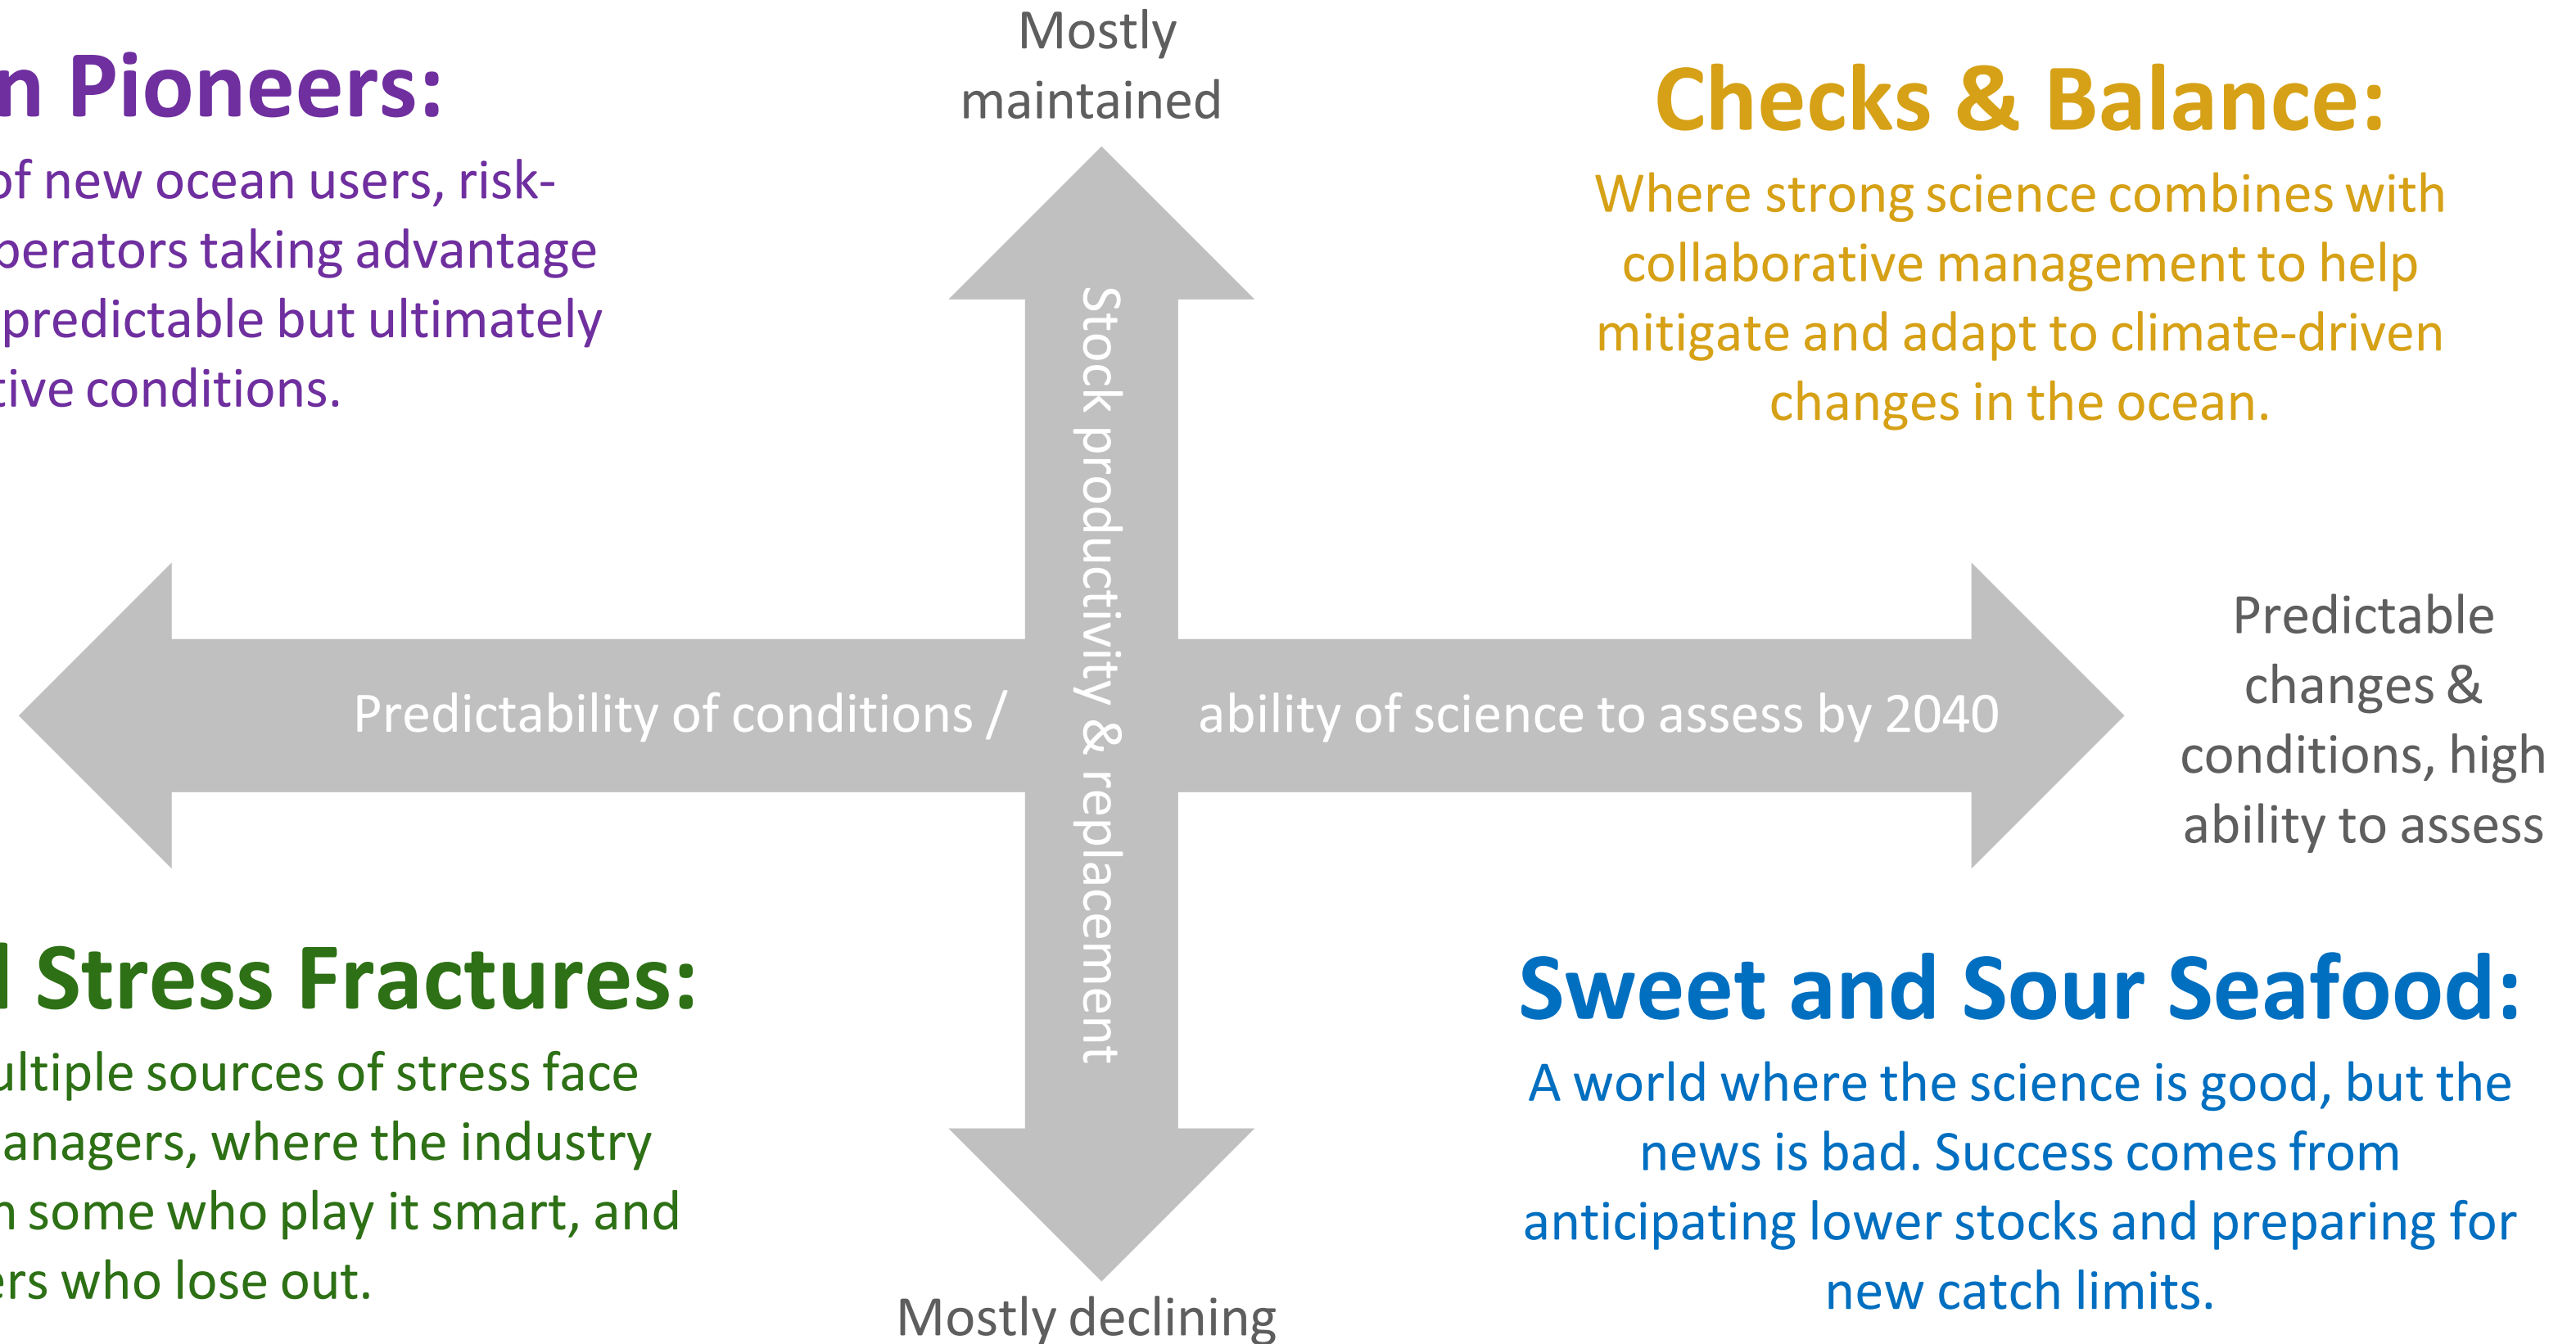

Where strong science combines with collaborative management to help mitigate and adapt to climate-driven changes in the ocean.

Predictable changes & conditions, high ability to assess

Sweet and Sour Seafood:

A world where the science is good, but the news is bad. Success comes from anticipating lower stocks and preparing for new catch limits.

Mostly declining

Features of Each Scenario: East Coast Fisheries in 2040

Ocean Pioneers: stocks maintained, but hard to assess / predict

- Weird weather and crazy conditions
- Life on the ocean is remarkably different compared to 20 years ago
- Climate change has prompted more investment in alternative energy and aquaculture
- Seasons and locations of fisheries change unpredictably, and traditional science is unable to make accurate assessments
- Despite this, fishermen report they are encountering plenty of seemingly healthy stocks
- Ocean pioneers thrive in these turbulent conditions. Success doesn't come easy - it requires taking risks (such as investments in new data-gathering technology), deep pockets and an ability to ride out the storms of uncertainty

Features of Each Scenario: East Coast Fisheries in 2040

Compound Stress Fractures: stocks declining, and hard to assess / predict

- Several sources of stress have led East Coast fisheries to breaking point by 2040
- Shifts in ocean currents and extreme weather events have tipped ecosystems out of balance
- Major storms lead to more pollution and degraded habitats. Healthy stocks are scarce
- Low abundance leads to reduced harvests and protected species regulations close several fishing grounds
- Science is unable to help, as stock assessments data cannot cope with such a changeable and volatile ecosystem
- Trust between stakeholders is in short supply, illustrated by fractious debates over the siting of offshore wind installations
- Operators are forced to shift to lower trophic level species, and government support is needed to save a few selected fisheries

Features of Each Scenario: East Coast Fisheries in 2040

Sweet and Sour Seafood: stocks decline, but straightforward to assess / locate

- The science is good, but the news is bad
- Climate change is affecting ocean and stock conditions in ways long predicted by scientists
- Range shifts; productivity and abundance have declined for most relevant species
- Better forecasting helps fishermen prepare for marine heatwaves and localized die-offs
- Aquaculture provides a much-needed alternative as wild-caught seafood declines, and better science ensures that any pollution dangers are minimized
- There are signs of a few smart management decisions (such as limits on newly arriving species) and adaptation from fishing operators
- However, most management approaches have not adapted to the tougher conditions of today, and those on the horizon

Features of Each Scenario: East Coast Fisheries in 2040

Checks and Balance: stocks maintained, and straightforward to assess / locate

- Good science, smart collaboration, and tolerable conditions allow East Coast fisheries to cope with the challenge of climate change in 2040
- But nothing is easy: stocks shift and expand their ranges, while busier coasts and new offshore activity create accessibility challenges for commercial and recreational fishermen
- Investments in habitat protection and restoration begin to reverse decades of damage and loss
- Science capacity is boosted, delivering improved ocean monitoring, real-time catch reporting and population monitoring
- A prosperous ocean economy leads to competition (e.g., between fisheries and aquaculture) but also collaboration (e.g., as fisheries science is boosted by wind energy installations)
- Gentrification creates concerns over accessibility for the recreational sector

Application Phase: July 2022-Early 2023

Use scenarios as a **platform** to discuss future fishery governance and management issues:

- How well would our current systems work if these new scenario conditions were to occur?
- What would need to change to better prepare for these scenario possibilities?
- What are the tools and processes that need to be advanced now to ensure that fisheries are governed and managed effectively in an era of climate change?

Current Phase: Applications

Managers'

In person, ~50
participants

**Review & prioritize
recommendations**

1. Management and Industry Adaptability

2. Data & Science

3. Alternative Ocean Uses

4. Cross Jurisdictional Governance & Management

Challenges, Opportunities and Suggested Actions

For Each Scenario...

Adaptability

What does successful adaptability / nimbleness look like for managers? For industry?
What are the main barriers to effective adaptability?
If you knew that this scenario was going to play out, what actions would you take now so that operators, communities and managers could better adapt to cope with these conditions?

Data & Science

What are the biggest data & science challenges/opportunities facing fishery managers?
If you knew this scenario was going to play out, what actions should fisher managers take to ensure that data & science contributed to fisheries' success?

New Ocean Uses

What are the most significant challenges/opportunities for fishery managers posed by new ocean uses?
If you knew this scenario was going to play out, what would you do now to ensure that alternative ocean uses resulted in a positive or minimal impact on fisheries?

Cross-jurisdictional Governance & Management

What major stresses would be placed on existing cross-jurisdictional governance arrangements?
Would current approaches for updating management authority work well? What new ways should be considered?
What management challenges are present for species that move across jurisdictional boundaries?
What actions / changes are needed to better manage species that move across boundaries?

Jessica Coakley, MAFMC

ASMFC Habitat Committee
November 7, 2022
Long Branch, NJ

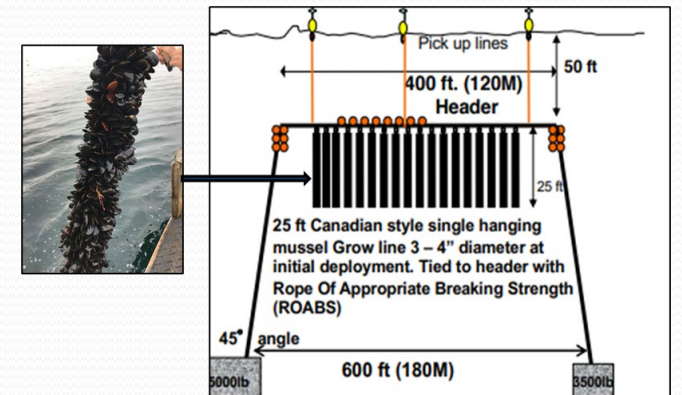

Council policies on habitat & non-fishing activities

- Both Councils have multiple policies that outline conservation concerns and best practices related to non-fishing activities and fish habitat, fish, and fisheries
- The Councils rely on these policies when developing comments on individual projects or on regional planning issues
- Specifically, the policies allow Council staff to craft comments without needing Committee/Council approval
- Policy development process useful for educating Council members, staff, and others on issues related to non-fishing activities
- There is close coordination between the two Councils on policy development and project-specific comments
- We periodically update these policies as needed

Aquaculture backgrounders

- Activity overview
 - Species cultured, by state
 - Areas where aquaculture occurs
 - Permitting and authorization process (federal and state)
- Potential impacts on species and habitats
 - Positive impacts
 - Adverse effects (fish, shellfish, interactions between managed species and aquaculture)
- Potential interactions with other marine and coastal activities
- References and best management practices
- [NEFMC backgrounder](#), [MAFMC backgrounder](#)

Policy overview

- Introductory section explains Council role in EFH and HAPC designation and consultation
- Councils seek development compatible with the protection of managed species and their habitats, and with commercial and recreational fishing activities
- Recognizes that aquaculture contributes to food production and is a valued use of the coastal zone and EEZ
- Emphasizes early and often approach to consultation/engagement
- Emphasizes the importance of considering cumulative effects
- Identifies audiences for the policy
- Links to [NEFMC policy](#) and [MAFMC policy](#)

Principles in the aquaculture policies

1. Site and design projects in the context of ecosystem functions and services
 - Consider distribution of specific sensitive habitats, etc.
2. Adopt operational practices to reduce environmental effects
 - Secure gear, use native/naturalized species when possible, etc.
3. Consider cumulative effects
4. Contribute positively to local coastal economies
5. Develop in the context of other sectors, policies, and goals
 - Consider distribution of fishing grounds and potential for adverse interactions, start with pilot scale projects, use high quality data to understand other uses
6. Clear and ongoing communication is important

Ongoing engagement

- Council staff communicate regularly with aquaculture coordinators at GARFO
- GARFO and Council staff give updates at Committee and Council meetings
 - Specific projects, regional planning, e.g., Aquaculture Opportunity Areas
- Participate in interagency meetings when possible
- Prepare Council comments

 - <https://s3.us-east-1.amazonaws.com/nefmc.org/201222-NEFMC-to-GARFO-EPA-USACE-BWF-re-Blue-Water-Fisheries-project.pdf>
 - <https://s3.us-east-1.amazonaws.com/nefmc.org/201218-NEFMC-to-NOAA-re-AOA-RFI.pdf>
- The two councils work individually and jointly as needed

NEFMC Atlantic Salmon Aquaculture Framework

- Salmon FMP prohibits directed fishing and possession in federal waters and allows for authorization of salmon aquaculture via a framework action
- Recent offshore aquaculture proposal (Blue Water Fisheries project) spurred the Council to consider developing an action to facilitate salmon aquaculture
- An action to authorize possession of cultured Atlantic salmon would provide a clear path forward for salmon aquaculture projects in federal waters
- On September 28, the Council initiated an action to consider authorizing possession of cultured Atlantic salmon in the EEZ
- Council is working on this action now, with a goal of final action in April 2023

NEFMC Framework, continued

- Complex issue that requires awareness of the aquaculture permitting process that involves multiple federal agencies
- Desire to keep the scope of the action narrow, while considering related activities and consultations as appropriate
- Need to be somewhat future-proofed; best practices for project design and monitoring will evolve
- Council does not have a standing Atlantic Salmon Committee or Plan Development Team
- Involving a diverse group in framework development – Council staff; GARFO aquaculture, habitat, protected species, NEPA; NEFSC social and habitat scientists; state agency staff; staff at EPA and USACE

NOAA AQUACULTURE STRATEGIC PLAN (2023-2028)

First-ever 5-Year Strategic Plan for Aquaculture to guide the agency's work from 2023-2028.

Goal 1: MANAGE SUSTAINABLY AND EFFICIENTLY

Goal 2: SCIENCE FOR SUSTAINABILITY

Goal 3: EDUCATE AND EXCHANGE INFORMATION

Goal 4: SUPPORT ECONOMIC VIABILITY AND GROWTH

Federal Coordination on Aquaculture

E.O. 13921 Promoting American Seafood Competitiveness and Economic Growth

Covers reducing regulatory barriers for commercial fishing and aquaculture & improving seafood trade

- Removing Barriers to American Fishing
- Combating Illegal, Unreported, Unregulated Fishing
- Removing Barriers to Aquaculture Permitting
- Aquaculture Opportunity Zones
- Improving Regulatory Transparency for Aquaculture
- Updating National Aquaculture Development Plan
- Promoting Aquatic Animal Health
- International Trade

Subcommittee on Aquaculture

www.ars.usda.gov/SCA

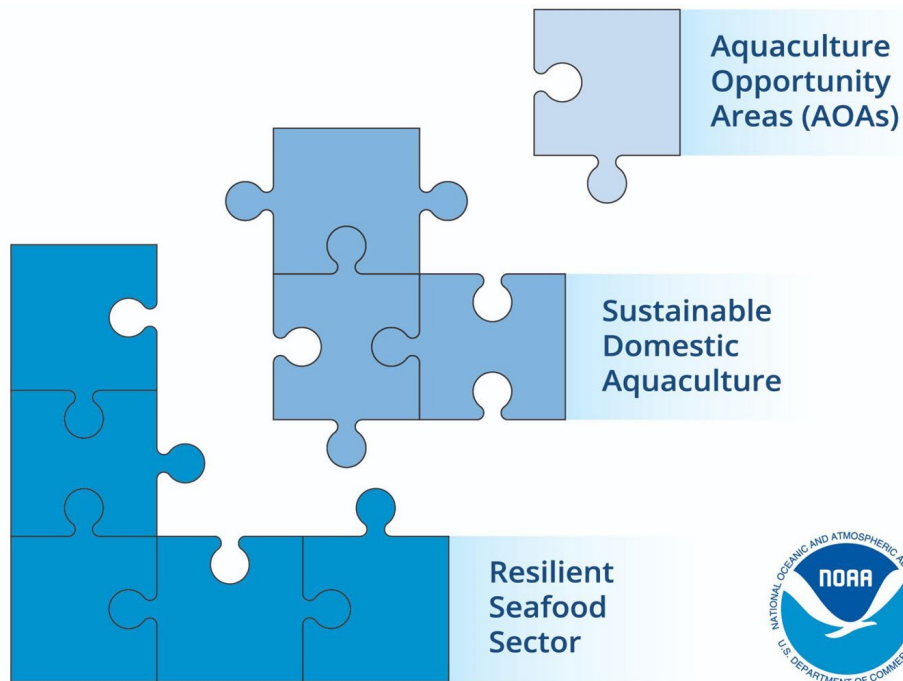

The Subcommittee on Aquaculture (SCA) serves as the Federal interagency coordinating group to increase the overall effectiveness and productivity of Federal aquaculture research, regulation, technology transfer, and assistance programs.

- established pursuant to the National Aquaculture Act of 1980.
- members: USDA, DOC, DOD, EPA, and DHHS.

EO 13921: directs Secretaries of Interior, Agriculture, and Commerce, in consultation with the SCA, to “...assess whether to revise the National Aquaculture Development Plan” and “...shall subsequently assess, not less than once every 3 years, whether to revise the National Aquaculture Development Plan...”

- National Strategic Plan for Aquaculture Research (Feb. 2022)
- Strategic Plan to Enhance Regulatory Efficiency in Aquaculture (Feb. 2022)
- Draft Economic Development Outline

Aquaculture Opportunity Areas and Expanding U.S. Seafood

AOAs are one piece of a larger strategy to expand domestic aquaculture and complement wild-caught seafood.

Taken together, these are critical to the resilience of the U.S. seafood sector.

**NOAA
FISHERIES**

What is the goal of this effort?

- Meet the directives of Executive Order 13921
- **To utilize a science-based approach to inform offshore marine aquaculture planning**
- Find areas that could be suitable for multiple future offshore aquaculture projects
- Address interests and concerns regarding offshore aquaculture siting
- Address the increasing demand for seafood
- Promote American seafood competitiveness, food security, economic growth while also sustaining and conserving marine resources

NOAA
FISHERIES

What is an Aquaculture Opportunity Area?

Aquaculture Opportunity Areas show high potential for commercial aquaculture. A science and community-based approach to identifying these areas helps minimize interference with other enterprises, account for current fishing patterns, and protect the ecosystem.

AOAs will expand economic opportunities in coastal and rural areas, and increase our nation's seafood security.

AOAs use the best available science to find appropriate spaces for sustainable aquaculture.

AOAs minimize interactions with other users, such as shipping, fishing, and the military.

Assessment and Use of AOAs

Stakeholder input is essential in the design and location of AOAs and NOAA expects these areas will be shaped through a public process that allows constituents to share their community and stewardship goals, as well as critical insights.

AOA size, exact location, and farm types will be determined through spatial analysis and public input to expand sustainable domestic seafood production while minimizing potential user conflicts. Farms will still need to go through the permitting process and environmental reviews.

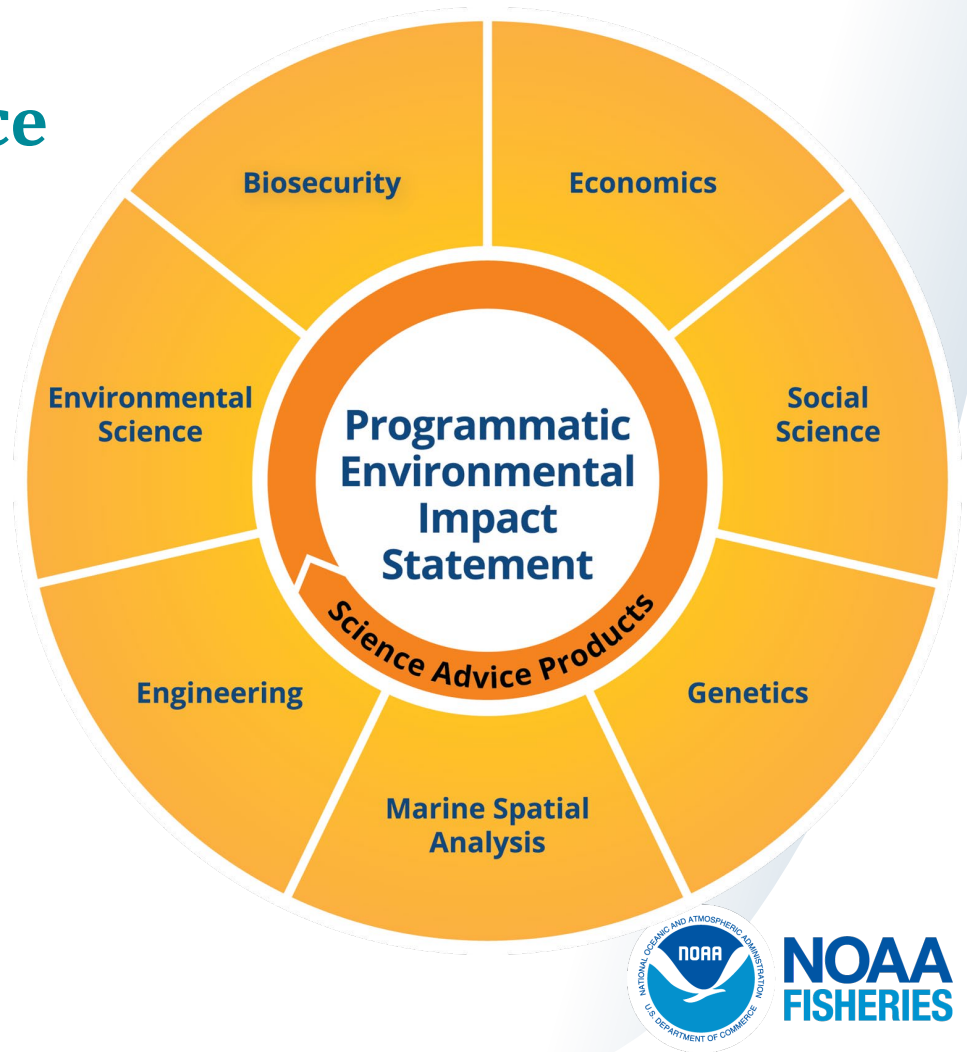

AOA Atlases - Gulf of Mexico and Southern California

[noaa.gov/news-release/noaa-analyses-to-inform-aquaculture-siting-in-gulf-of-mexico-and-southern-california](https://www.noaa.gov/news-release/noaa-analyses-to-inform-aquaculture-siting-in-gulf-of-mexico-and-southern-california)

Multidisciplinary Science

Use the best available science across multiple disciplines, public and stakeholder input, and relevant regulations, laws, policies, to evaluate the beneficial and adverse impacts of siting aquaculture in a given area.

NOAA
FISHERIES

Overview of AOA PEIS Process and Timeline

- ✓ Publish Notice of Intent and initiate 60 day formal public scoping period
 - Consider public comments
 - Develop draft PEIS
 - Notice of Availability of draft PEIS in Federal Register and formal public comment period
 - Consider and respond to public comments (in final PEIS)
 - Publish final PEIS
 - Publish Record of Decision (30-day waiting period)

GOAL: Two years from publishing of NOI to signing of ROD

**NOAA
FISHERIES**

Selecting the next AOA Region(s)

Interest in four areas:

- Western Pacific/Guam
- USVI and Puerto Rico
- Florida
- Alaska for shellfish and seaweed aquaculture (state and federal waters); Governor support and invitation into state waters

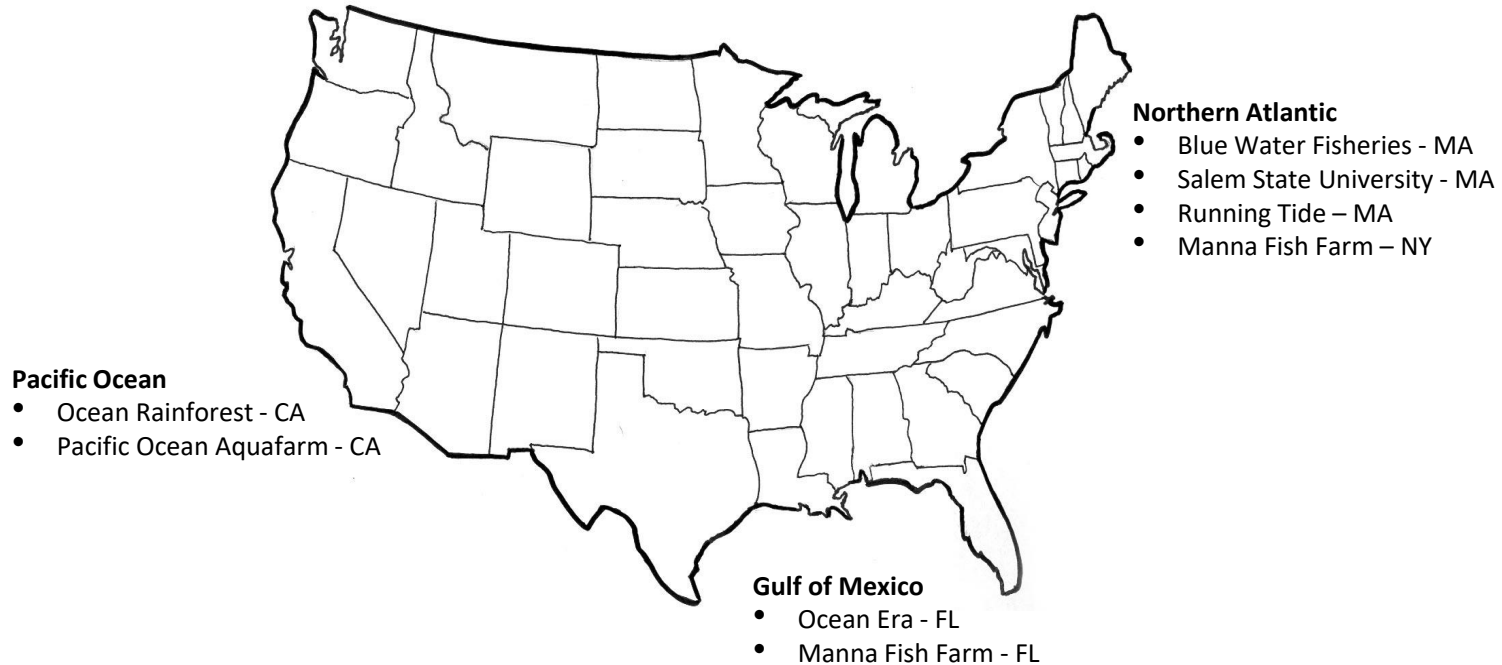

NOAA
FISHERIES

EO 13921, Section 6: Removing Barriers to Aquaculture Permitting

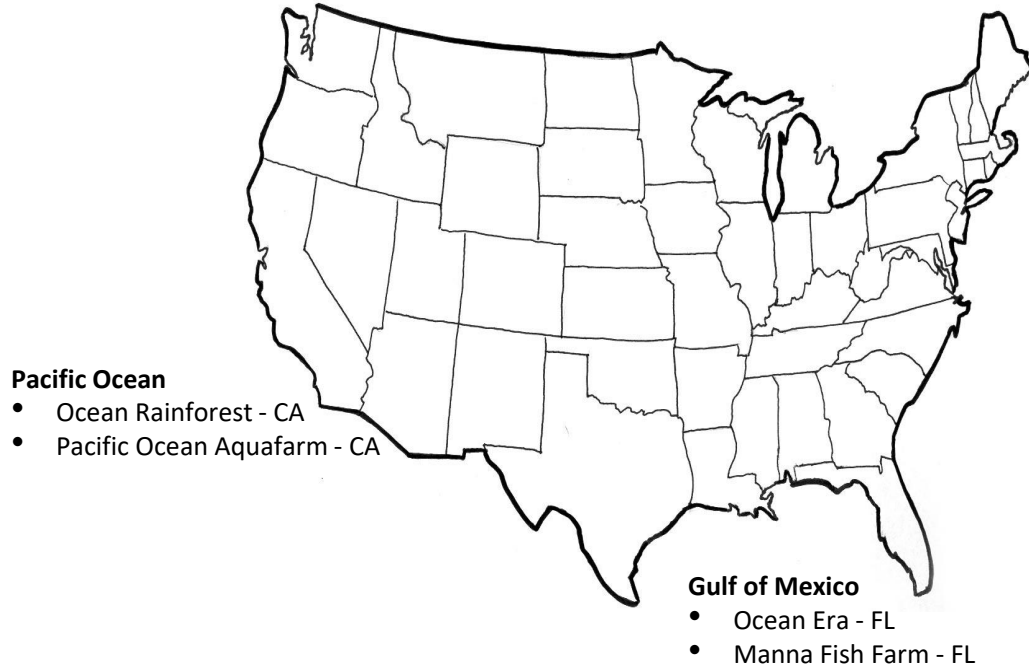

- Complete all environmental reviews and authorization decisions within 2 years once the Federal agencies determine an environmental impact statement (EIS) will be prepared
- Under certain conditions, NOAA is the NEPA lead Federal agency for aquaculture projects located outside of the waters of any State or Territory and within the EEZ
 - When there are two or more reviews/authorizations
 - When an EIS is prepared

NOAA FISHERIES

Office of Aquaculture

Shellfish and seaweed aquaculture can increase food production, create economic opportunities in coastal areas, and enhance natural harvests.

These aquatic crops provide important ecosystem services that can improve water quality around farm sites.

Aquaculture farms can also provide habitat for fish and crustaceans, benefiting wild populations.

Aquaculture Provides Beneficial Ecosystem Services

REMOVING NITROGEN, IMPROVING WATER QUALITY

Nitrogen is an essential nutrient, but too much of it in water—often from excess fertilizer in runoff—boosts the growth of algae. Algae overwhelms water bodies and reduces oxygen levels, killing fish, crabs, lobsters, and other aquatic life. Fortunately, shellfish aquaculture has emerged as a promising, low-cost tool to help improve water quality.

Around the nation, shellfish and seaweed farms (many of which are family-owned) are providing sustainable seafood and improving the surrounding environment. These farms are described as “low-to-no input,” because feed, fresh water, and fertilizer typically aren’t necessary for their crops. By raising shellfish and seaweed, farms improve access to local seafood and mitigate the harmful effects of excess nutrients, ocean acidification, and habitat loss.

As shellfish filter feed, they remove nitrogen by incorporating it into their shells and tissues. An adult oyster can filter up to 50 gallons of water a day, while a large quahog can clean about 24 gallons of water a day. A farm with 100,000 oysters per acre can potentially filter up to 5,000,000 gallons of water per day, per acre.

NOAA scientists are studying the nitrogen removal that shellfish aquaculture can provide to coastal communities. Coastal communities are increasingly adding shellfish aquaculture to help meet water quality goals. Waterfronts along the Chesapeake Bay and on Cape Cod are looking into seeding and growing shellfish as a way to reduce excess nitrogen in their local waters.
