MEMORANDUM

October 27, 2015

To: Atlantic Menhaden Management Board

From: Biological Ecological Reference Points Workgroup

RE: Ecological Reference Point Recommendations for Draft Amendment 3 Development

The Biological Ecological Reference Points Workgroup (BERP WG) has been tasked to develop ecological reference points (ERPs) that will be considered with changes to the Atlantic menhaden management program in Draft Amendment 3. In the *Ecological Reference Points for Atlantic Menhaden* report, the BERP WG presented a suite of preliminary ERP models and ecosystem monitoring approaches for feedback as part of the 2015 Benchmark Stock Assessment for Atlantic Menhaden (Appendix E, SEDAR 40 Stock Assessment Report). In August, ASMFC conducted a facilitated workshop with managers and stakeholders to develop specific ecosystem and fisheries objectives to drive further development of ERPs.

At its October meeting, the BERP WG used the outcome of this Ecosystem Management Objectives Workshop (EMOW) and the SEDAR 40 peer review recommendations to assess the ability of each ERP model or tool to address management objectives and performance measures. The BERP WG identified fundamental objectives and performance measures from the EMOW that can be addressed using ecological models and approaches. Objectives such as “Sustain Atlantic menhaden to provide for historical and cultural values” or “Achieve broad public support for management” would require additional data (e.g., socioeconomic) or identification of relationships that are outside the purview of the BERP WG.

Based on committee deliberations, the BERP WG recommends using a surplus production (Steele-Henderson) and a multispecies statistical catch-at-age model to formulate potential reference points. Table 1 summarizes the recommended models and the fundamental objectives each model can address as well as the associated performance measures. Models were selected based on: (1) the ability to address multiple management objectives; (2) the ability to predict and monitor performance measures in response to management action; (3) technical merits; and (4) adherence to the advice from the SEDAR 40 Peer Review. Additionally, a majority of the BERP WG was in favor of using ecosystem indicators (e.g., forage indices or predator prey ratios) as a monitoring tool, which would give an empirical indication on performance of some management measures and indicate when to use modeling tools to assess the system. A minority of the BERP WG suggested that the ecosystem indicators be considered to develop harvest control rules as standalone alternatives to the other modeling approaches. At the next meeting of the BERP WG, the minority members will provide examples for committee consideration, and a final recommendation will be made. Currently, the BERP WG recommends their use only in an ecological context in conjunction with the other approaches rather than as standalone indicators.

The BERP WG also discussed models that are in development outside of the committee. External models such as a coastwide Ecopath with Ecosim and another surplus production model will be explored and compared to BERP WG modeling efforts as appropriate during the BERP

M15-91

WG process. Because these efforts are not a draw on committee time, the BERP WG agreed that the findings from these models would be useful to compare to BERP WG modeling outputs to check for convergence.

The BERP WG notes that the timeline for model development and subsequent review will exceed the current tentative timeline for Draft Amendment 3. Creating ERPs from these models will take three to four years before being ready for management use. Three to four years is on the order of a new stock assessment with the added complications associated with modeling multiple species using a suite of models in order to address management objectives. The multispecies models will require six months to a year to complete development of the code. Because these are complex, brand-new models, the BERP WG and the menhaden TC will require a year or two to review and test the models, to ensure that the code is correct and the models are robust and performing well. During this time, the BERP WG and the TC will also have to gather, vet, and update all inputs for a standard single-species assessment for menhaden, as well as the same data for all the predators included in the model. During this process, the BERP WG will periodically present updates to the Board and request feedback where applicable. Once the BERP WG and TC are satisfied with the performance of the models and the final model runs are completed, the models and inputs will have to be peer-reviewed, then presented to the Board, which will require three to six months. When the Board has accepted the multispecies assessment framework, the BERP WG will conduct a Management Strategy Evaluation (MSE) to quantify the effects of different levels of fishing mortality on the objectives identified by the Board. This will allow the Board to examine the tradeoffs between different objectives and select ERPs that achieve the desired balance between all objectives. The MSE will require six months to a year, depending on the range of options the Board wants to consider.

In the interim, the BERP WG recommends that the Board continue the use of the BAM single-species biological reference points as accepted for management use from the 2015 Benchmark Stock Assessment for Atlantic menhaden. The Board may also consider an *ad hoc* ecological control rule such as those found in the Lenfest Forage Fish Report¹, $E=F/Z = 0.4$ ², $SPR = 30$ or 50% ³ as well as others outlined in Department of Fisheries and Oceans Canada review⁴. Although these *ad hoc* reference points are easily calculated, they are generalized rules of thumb based on meta-analyses of multiple species. The BERP WG previously reviewed the Lenfest Forage Fish Report and did not feel that the management actions recommended in that report are appropriate for Atlantic menhaden management (see Memo M15-30). The BERP WG met with the Lenfest Forage Fish Task Force in August and maintains its original position. Additionally, none of the *ad hoc* approaches will allow for an evaluation of the tradeoffs between management objectives for menhaden and predators without the development of a multispecies MSE framework and forward projections of a multispecies model.

The BERP WG will present these recommendations for approval and tasking from the Atlantic Menhaden Management Board at its November 3rd meeting. Once approved, the BERP WG will move forward with the assessment process.

For more detailed information, please see the Ecosystem Management Objectives Workshop Report, the October meeting summary of the BERP Workgroup, and the April BERP WG memo on the ASMFC website: <http://www.asmfc.org/species/atlantic-menhaden>.

Table 1: BERP WG recommended modeling approaches to develop ERPs for Atlantic menhaden and the fundamental objectives they address.

	FUNDAMENTAL OBJECTIVES										Timeline for Management Use
	Sustain menhaden to provide for fisheries				Sustain menhaden to provide for predators				Provide stability for all types of fisheries		
	PERFORMANCE MEASURES										
	Abundance/ biomass of menhaden	Menhaden yield objectives	Age Composition	Historical distribution (Age comp as proxy)	Abundance/ biomass of predators	Predator yield objectives	Predator nutrition	Prey availability relative to predator distribution	Stability in yield for directed menhaden fisheries	Stability in yield for non-menhaden fisheries	
Single-Species Models											
BAM Statistical Catch-at-Age Model (current model)	X	X	X	X					X		Ready now
Multi-Species Models											
<i>Surplus Production</i>											
Steele-Henderson	X	X					X (proxy)		X		6 months-1 year, 2-3 years for committee review, peer review
<i>Catch-at-Age</i>											
Multi-species Catch-at-Age (MSSCA)	X	X	X	X	X	X	X (proxy)	*	X	X	1 year to finalize model, 2-3 years for committee review, peer review
*: Possible to develop a spatially-explicit version of the model that would meet that performance objective, but would require extensive additional work (10+ yrs)											
The WG also recommends that ecosystem indicators such as forage indices and predator nutrition be monitored as part of a comprehensive ecosystem approach. Progress on additional ecosystem models being developed by outside groups (e.g., time-varying r, Ecopath with Ecosim) should also be monitored.

MEMORANDUM

October 27th, 2015

To: Atlantic Menhaden Management Board
From: The Committee on Economics and Social Sciences
RE: Socioeconomic Study of Menhaden Fisheries - Request for Proposals Update

As discussed at the August meeting of the Atlantic Menhaden Management Board (Board), the Committee on Economics and Social Sciences (CESS) is developing a Request for Proposals (RFP) to conduct a study on the socioeconomics of Atlantic menhaden commercial fisheries. The research will be funded through a cooperative agreement with NOAA Fisheries. The CESS met in September to discuss the direction of the RFP and potential project deliverables. The CESS decided that a characterization of the coastwide menhaden fishery is a necessary first step in order to then perform economic analyses to describe the trade-offs of various allocation strategies and assist fishery managers in allocation decisions. The research should build on a previous study, Kirkley et al. 2011, as a general framework and expand the research to the coastwide level. These data are needed before economic analyses can be performed to optimize allocation. Information from the project will be made available to researchers and future RFPs designed to explore allocation trade-offs.

The CESS generated an anticipated set of deliverables the project should generate to inform management decisions, while being cognizant of budgetary and time constraints. In an October call, a subcommittee of the CESS reviewed and refined the project deliverables, and determined primary and secondary project objectives. The primary objective of the project will be to explore social equity and the distributional consequences of management change on both the Atlantic menhaden commercial bait and reduction fisheries. The research contract is anticipated to begin in early 2016, with deliverables expected in early 2017.

While the CESS understands that analyses exploring the trade-offs among allocation options may be a top priority of the Board, the Committee believes that a characterization of the commercial fishery is necessary before these analyses can be performed. This project will still provide valuable social and economic information. The suggested list of primary project deliverables can be found below. However, the CESS suggests that the Board allocation subgroup meet with the CESS RFP subcommittee to provide feedback on project objectives and deliverables to ensure that the information collected is the most beneficial to the management objectives of the Board. If the Board agrees that the allocation subgroup should meet with the CESS RFP subcommittee, additional time will be necessary for RFP development, leading to a short delay in the project starting, but deliverables will still be expected early 2017. The CESS will ask the Board to provide suggestions on how to proceed during its November 3rd meeting.

Primary Objective: *Define social equity and the distributional consequences of management change on both the Atlantic menhaden commercial bait and reduction fisheries.*

Identify political and social resources: individuals, families, firms, and communities (including social organizations, power, and leadership)

Anticipated project deliverables:

Characterize the bait fishery coast-wide in context

The harvesting sector of the fishery:

- Trend in pounds caught per year (by state)
 - Concentration in specific ports
- Trend in average and total revenues from menhaden (by state and year)
 - Distribution of revenues
 - Operational costs
- Vessel and gear characteristics
- Participant information
 - Demographics, education, distribution, longevity in fishery, income
- Employment in the sector
 - Alternative employment opportunities (by state/county)
 - Annual revenue shares by species/state to identify alternative targets and sources of fishery revenues
- Participation in fishery (direct dependence)
 - Number of fishermen and boats (historic and current employment, including crew)
 - Identify what extent fishermen focus on menhaden as a primary catch and during what seasons
 - Attitudes, beliefs, norms, values, perceptions
 - Job satisfaction, health safety
 - Importance of menhaden
 - Directly or via ecosystem services
 - Networks (crew, friends, family)
- Identify in-/direct subsidies, e.g., fuel subsidies, tax breaks etc.
- Identify substitute bait products and their average dockside prices by state

Processing and distribution sector:

- Number of bait retailers and wholesalers that sell menhaden (by state)
 - Number/types of employees
 - Income by position
 - Total bait sales and proportion of menhaden sales
- Distribution of the product
 - Identify the clients or purchasers (both commercial and recreational)
 - Identify the product forms and prices
 - Wholesale with prices and area
 - Retail with prices and area

- Preferred form for each targeted fish species and user type

Characterize the reduction fishery in context:

The harvesting sector of the fishery:

- Trend in landings and revenues ideally with operational costs
- Time series with capacity utilization and fixed costs
- Time series in quantity of quota allocated, quota landed, and menhaden processed
- Participation in fishery (direct dependence)
 - Trend in number and demographics of employees
 - Estimate the share of income these employees represent in their communities
 - Attitudes, beliefs, norms, values, perceptions
 - Job satisfaction, health safety
 - Importance of menhaden
 - Directly or via ecosystem services
 - Networks (crew, friends, family)
- Population, education of communities of interest
 - Vulnerability
 - Alternative employment opportunities

Shoreside entities:

- Importance in the community in terms of how many direct and ancillary jobs supported, etc.
 - Change over time
- Uses of the reduction fishery product with info about supply chains
 - Substitutes for the product
 - Trends in prices for possible substitutes
- Identify in-/direct subsidies, e.g., fuel subsidies, tax breaks etc.

Mr. Robert Boyles
Chairman, Atlantic Menhaden Management Board
Atlantic States Marine Fisheries Commission
1050 N. Highland Street, Suite 200 A-N
Arlington, VA 22201

Dear Robert,

At its November 3rd meeting, the Atlantic Menhaden Management Board will be asked to provide guidance to the Plan Development Team on the preparation of a Public Information Document for Draft Amendment 3. I write now to urge you and your board members to include a Lenfest approach among the options listed in that document and to encourage the Board to stay on a track that would result in the implementation of Amendment 3 in 2017.

The Lenfest approach is well documented in the scientific literature for the setting of ecological reference points and is best suited to meet the objectives that were agreed to by the Ecological Management Objectives Workshop. Furthermore, it is the only methodology that can be applied immediately to the management of Atlantic Menhaden without further modeling efforts and peer review. While we do not object to the development of more complex multi-species models, reliable versions of these will require a significant investment in staff resources and are likely years away.

The Coastal Conservation Association has long supported management efforts that provide an adequate supply of menhaden for the entire food web. The Lenfest approach is specifically designed to meet this important objective and can do so in the shortest time frame. Its inclusion in the Public Information Document will allow the public an opportunity to comment on an option that is scientifically justified and available for immediate use by the managers.

Thank you for your consideration of this request.

Sincerely,

David Sikorski

Chair-Government Relations Committee
