I want to emphasize something that is directly supported by this addendum: what happens in Chesapeake Bay affects the entire East Coast. The Bay is the largest nursery system on the Atlantic coast, and fish that begin their lives there — especially striped bass — migrate throughout New Jersey waters and far beyond. Ospreys, whose reproductive success is tied to menhaden availability, also depend on this system. When menhaden availability declines in Chesapeake Bay, the effects ripple outward. Here in New Jersey, we feel those impacts in our fisheries, our wildlife, and our coastal economy. Protecting the Bay's forage base is not just a Chesapeake Bay issue — it is a coastwide issue, and New Jersey has a direct stake in getting this right.

The addendum shows how the Bay Cap has become increasingly misaligned with the TAC. The 20% TAC reduction in 2026 increased the percentage of possible reduction harvest taken inside the Bay from 32% to 40% (Draft Addendum II, p. 2). That is exactly the kind of shift the Bay Cap was designed to prevent.

The addendum also documents that over 50% of Bay reduction landings occurred in a six-week window in 2023 and 2024 (Draft Addendum II, p. 2). Concentrated removals in mid-summer can affect availability to predators and other fisheries — again, directly within the scope of this amendment.

The fishery-dependent and independent data included in the addendum justify precautionary action. Pound-net CPUE declined sharply in 2024 across Maryland, PRFC, and Virginia (Draft Addendum II, p. 9). The Choptank River gillnet survey shows a dramatic drop in adult menhaden abundance in 2024 and 2025 (Draft Addendum II, p. 12). These indicators point to reduced availability in the Bay's nursery system.

For these reasons, I support a meaningful reduction in the Bay Cap, consistent with the options provided. Among the available choices, Option B4 (a 50% reduction to 25,500 mt) or Option C1e (setting the Bay Cap at 13.6% of the TAC) best reflect the precautionary intent described throughout the document.

I also support establishing quota periods under Section 3.2. The addendum clearly shows that recent mid-summer concentration of reduction harvest may affect availability to other fisheries and predators. Quota periods are a practical tool to prevent this.

Finally, I strongly support Option B in Section 3.3, requiring the Bay Cap to be revisited every three years. The Bay Cap has not been adjusted since 2018 despite multiple TAC changes and new ecological information. A revisit provision is essential for adaptive management.

In summary, Draft Addendum II correctly identifies real, documented problems with the Bay Cap's size, timing, and alignment with the TAC. The most precautionary options — B4 or C1e, quota periods, and a three-year revisit requirement — best address the issues raised in the document and support the ecological and fishery objectives described in Section 2.1.

Thank you for considering my comments."

My Additional comments related to but not allowed during the 3 minutes:

According to the ASMFC's own Atlantic menhaden assessment brief from September 2026, the previous assessment contained a major error. When natural mortality was corrected, the stock was shown to be about 37% smaller than previously estimated. Under the corrected science, the old TAC of 233,550 metric tons has a 100% probability of overfishing. That is not a debate — that is a management failure.

And we are seeing the consequences right now in New Jersey waters. There are no adult menhaden in our schools. Almost everything is peanut-bunker-sized — pre-spawn juveniles. This distorted age structure is a direct result of years of inflated quotas built on incorrect science.

Between 2023 and 2025, the fishery harvested hundreds of millions of extra pounds because the TAC was wrong. Even with those inflated quotas, the fishery only landed about 80% of the TAC in 2024, and similar underperformance is expected in 2025.

The 20% ocean TAC cut for 2026 was a paper cut, not a real reduction. And the Bay Cap hasn't moved. One point keeps getting confused: the Bay Cap is not extra quota — it is a sub-limit inside the coastwide TAC. At 51,000 mt against a 186,840 mt TAC, it represents 27% of the entire allowable catch. Adjusting it matters for Chesapeake Bay, but it does not fix the coastwide overfishing created by the assessment error.

Tonight's hearing may focus on Chesapeake Bay, but it is directly connected to the ASMFC's November 10 meeting, where the Commission will set 2027–2029 specifications, consider Addendum II for final approval, evaluate quota reallocation, and review state compliance.

What happens tonight feeds directly into those decisions. If we ignore the coastwide implications of the assessment error, we will lock in three more years of mismanagement.

And we need to be honest: we are witnessing the failure to preserve the forage-fish base of the entire East Coast ecosystem. Atlantic herring collapsed. Alewife and blueback herring are severely depleted and continue to be discarded at sea as bycatch without being recorded. For decades, nature relied on abundant menhaden to fill those gaps.

If menhaden collapse, there is no turning back. Ospreys have already shown us what happens when the forage base disappears — everything is connected. To prevent further collapse, the TAC needs to be well under 100,000 metric tons, to be consistent with the ERPs, and to ensure that all living creatures that depend on menhaden for survival can do so.

Reallocation is an additional danger. Maine's landings have surged as Atlantic herring collapsed, and the lobster industry wants more bait. That is real economic pressure — and a real conservation risk. The last three seasons show that the remaining adult, age-3-plus spawning stock is migrating north faster than the rest. If quota is shifted to New England, those older fish — the brood stock — will be the first to be eliminated. If that happens, recruitment collapses, and there is no path back.

Reallocation without a meaningful TAC reduction is the wrong direction, and changing state allocations requires a full addendum under Amendment 3 — not a quick decision in November.

New Jersey's coastal economy depends on forage. Our anglers, charter fleet, bait shops, and wildlife observers are already seeing the impacts.

ASMFC made the error. ASMFC must fix it.

I urge the Board to: – Reduce the coastwide TAC by at least 50%, consistent with corrected ERP science; – Maintain an independent Bay Cap; – And ensure reductions are real, not paper cuts.

The science is clear. Now the Commission needs to act."

We respectfully request that you immediately task the Atlantic Menhaden Technical Committee with incorporating the newly published natural mortality estimate from Ault and Luo into the analyses supporting the 2027-2029 harvest specifications that will be presented to the Atlantic Menhaden Management Board in November.
The Ault and Luo paper, "Investigation of Atlantic menhaden mortality rates," estimates natural mortality, or M, at approximately 0.50 per year - substantially below the mortality assumption used in the 2025 assessment. Natural mortality is a foundational input that can materially affect estimated abundance, fishing mortality, fecundity, stock status, ecological reference points, and sustainable harvest levels.
The 2025 assessment demonstrated that the results are sensitive to this assumption: incorporating a lower mortality rate following correction of the earlier tagging analysis substantially reduced estimated biomass relative to the prior assessment. The Ault and Luo estimate is lower still. The Board should not be asked to select 2027-2029 harvest levels based only on the existing assumption without also seeing the results produced by the new peer-reviewed estimate.

These comments are to be submitted in writing to the ASMFC by Oct 8 2026

I monitor two osprey nests on my road in southern NJ. We lost half the osprey fledglings in Lower Bank, NJ this year. They starved to death because the parents abandoned them to go find food. They feed in the Mullica River and the menhaden population was too low to provide sufficient food for them. The offshore net fishing companies actively depleted the fish and there were very few in the river this year. Something urgently has to be done NOW or we will lose more of the osprey, as well as eagles and fish that feed on the menhaden. PASS Addendum II to help save these beautiful birds!!

Urgent action is needed to facilitate a comeback of menhaden in the Chesapeake bay. The 50% cut needs to be implemented before further damage is done. I guide on the Chesapeake bay and I am in tune with what is normal out in the bay. I've spent every safe weather day from April to November out on the water. Over the last 3 years I've seen a drastic decrease in menhaden populations in the tangier sound. This year being especially abysmal. Ospreys which rely heavily on menhaden have been virtually non existent to the waters of Tangier sound and this is an area where they should be widespread. Another indicator of population loss is the lack of blue fish in our waters. 3 years ago you couldn't throw a lure at a school of menhaden without hooking into one. This year I have caught 0 in the inshore areas of the Sound. 3 years ago you could see multiple large schools running the shore lines at one time on a daily basis. last year multiple smaller schools, this year virtually nothing. Something needs to be done, our resources are dying because of a dietary supplement. The economic impacts of recreational fishing has astronomically more of a positive impact than the menhaden business. This reduction should be a no brainer

Please protect the menhaden from over fishing in localized areas. We have plenty of data to support that this over fishing is not sustaining other life forms and they are starving to death. We need to transform to other means that do not throw ecosystems out of balance. We must support workers through a just transition to some other form of employment, but we cannot exhaust our fishes. There is too much depending on them for life.

Scientific data is showing that over fishing menhaden in US coastal waterways is decimating the osprey population as well as other wildlife. I am very concerned about the irreversible damage being done to our world.
Please enact laws that will protect our wildlife by restricting commercial fishing in our waterways.

Thank you,
Paula Lempart

I think we need to ensure the survival of the Osprey as a species and possibly consider putting them back on the endangered list. The lack of bunker has clearly caused a failure in this years breeding season. I have observed fewer nests in Oceanport over the past few years and especially this season. Additionally, it did appear that nesting pairs did not successfully raise young with many leaving nests in August instead of September. I support capping commercial fishing and protecting these very special birds.

I am a concerned citizen and a birder. It is tragic to see what is happening to the Osprey in our area. It doesn't have to be this way. Omega Protein should be prohibited from vacuuming up the Menhaden in the Chesapeake Bay. I would support the reduction of fishing by at least (not "up to") 50%. We have to speak up and protect those who cannot speak for themselves.

With so many environmental protections being removed by our national government, it is imperative that at a state level we do everything we can to maintain the ecological balance to protect endangered and really every animal species within our states natural boundaries! The fact that Osprey need menhaden or bunker fish—as I believe they are called both—and our lagoons on Osborn Island continue to endure what is being called “FISH KILL” seems ridiculous that state government hasn’t realized that they should fix the FISH KILL to allow more live bunker fish to feed the Osprey and other birds. We had thousands of bunker fish die and rot on the surface of our lagoons this July, August and early September due to dredging not being done by local and state agencies, to allow for schools of fish to enter and especially to exit the lagoons off the bay. The bunker cannot get back out to the bay at low tide and end up dying. Birds will not eat dead floating fish! Why haven’t the protective agencies for these birds thought to come net and catch these fish in July and August to prevent their wasteful death, when they can be used to feed the starving birds. Seems like fixing one problem then in turn helps to fix another. It’s common sense but government bureaucrats will have have lots of excuses why they “can’t do that”!
The organization, Save Barnegat Bay, is trying to get state agencies to all agree to address this problem of FISH KILL in Little Egg Harbor and Mystic Island, Osborn Island, however the wheels of government turn very slowly and unfortunately the bird populations suffer because no one will fix what’s killing thousands of bunker in Great Bay each summer for the last 10 years! Humans and animals all need each other in the delicate balance of life on planet earth and humans keep dropping the ball on

doing the right things to protect all of it! Please contact me if you wish further information or discussion. I do not even know if you have been made aware of the FISH KILL issue but it seems like it's intertwined with the birds not finding adequate food!

Dear Atlantic States Marine Fisheries Commission,
I am writing as a New Jersey resident after learning about the concerns surrounding menhaden and the unusually poor osprey reproduction reported in the Chesapeake Bay this year.
While I am not an expert in fisheries management, I have taken the time to learn more about this issue and have come to understand how important menhaden are as a food source for ospreys and many other fish and wildlife.
The 2026 Chesapeake osprey results have raised a very serious red flag. There are several factors that may be involved, including water temperature, salinity, weather, changes in where and when menhaden are available, fishing pressure, and other environmental factors. We don't yet know exactly how these factors are interacting, and that uncertainty warrants a precautionary approach.
That uncertainty is exactly why I am asking the Commission to take action now rather than waiting until the problem becomes difficult or impossible to reverse.
New Jersey has worked so hard to bring its osprey population back. I would like to see that success protected while we have the opportunity to do so.
I respectfully ask that the Commission support a meaningful reduction in the Chesapeake Bay menhaden harvest and a harvest schedule that leaves more fish in the water earlier in the season, while continuing to monitor the science and revisit

the decision as more information becomes available.
To me, this is simply a matter of being careful with an important part of the food chain.
Thank you for considering my comments.
Sincerely,
Denise Monesteri

I'm writing as a concerned citizen. It is extremely dismaying to read of the recent dive in osprey fledgling populations due to starvation. Everything points to lack of availability of their main food source, menhaden. I ask that the ASMFC reduce the allowable catch to let rhe population increase. Ospreys have been thriving and this rapid decline is something that can hopefully be addressed with your help.

As an AVID BIRDWATCHER im saddened to know there's not enough food for our EAGLES AND OSPREY. Since the commercial fishermen harvest more than theyll ever need they must be stopped from hauling i. Every available fish for themselves. We need to either restrict when and where they can fish. Its scary seeing our beautiful birds have to fight to survive. Its very unsettling to see them starve and fail in their health because there's not enough food for all . Please take this as a dire emergency for our birds who depend on these fish. Thank you

It's horrible what is happening with the osprey population! These birds are a treasure to all of us Americans. They keep us connected to the natural cycles of our world. Every year, I look forward to their return and celebrate the raising of their families. The last two years have been devastating here in New Jersey after chick after chick dies of starvation. Please do everything you can to ensure their food source is protected!!!! I know this is larger than just the Osprey issue. The food source is the food source for many other species and I'm worried about the collapse of our natural order that evolved overtime. We need to leave the menhaden for the wildlife that depends on it! Please make laws that ensures this happens!!!
Thank you.

I have a place in PA and NJ. I am a photographer and I have photographed the ospreys for the past eleven years at Peace Valley Park in Doylestown, PA and in Stone Harbor and Avalon, NJ.

I have witnessed that there have not been any chicks the past two years in Stone Harbor and Avalon, NJ. Prior to that there were so many and some even had three young ones in a nest. I see them hunting and hunting and barely finding a fish. I use to enjoy seeing the fledglings hunt in numbers while I sat on the beach. This year I didn't see any. I have seen them get flounder, bluegill and sharks this past summer but no menhaden fish. One time in the beginning of the summer they did get some on the beach in Avalon but they were tiny. Before the past two years, I would see them get large menhaden fish one after another and eat them on the top of my building.

At Peace Valley Park in Doylestown, I am seeing a couple of young and healthy ospreys. One day there were six ospreys there that most likely were migrating through. There are two there right now on a daily basis.

As a native New Jerseyan, I fully support measures to stabilize the food supply for coastal raptors. There must be protections in place to prevent the overfishing of menhaden and other food sources of the osprey. Osprey populations are crucial to NJ ecosystems and bring cultural value to our heavily commercialized beach areas.

Based upon the known decline of Osprey, specifically a dismal '26 breeding season, from New Jersey, through the entire mid-Atlantic region including the Chesapeake Bay area, due to decline and shortage of Atlantic Menhaden in coastal ecosystems. The lack of this staple food will place the Osprey back on the endangered species list with certainty.

The study & commentary can be seen under the study & data collections from Ben Wurst, Sr. Wildlife Biologist with Conservative Wildlife Foundation of NJ & lead of NJ Osprey Project. Please see published findings that support same, in the South Bergenite/ North Jersey.com 10/01/26 edition, and USA Today Network - New Jersey. Please support the reduction of a minimum of 50% of the Menhaden harvest/catch to support the existence of the Mid-Atlantic Osprey.
Thank you.

Dear Atlantic States Marine fisheries commission Menhaden management Board,

I support cutting the current 51,000 metric ton cap on Menhaden harvest to 25,500 metric tons.

Science has shown that recent steep declines in the Osprey population along the Chesapeake Bay is due to the increasing scarcity of Menhaden. This year and last, the osprey that normally build their nests along our creek off the Patuxent River are completely absent. Menhaden are the essential food source not only for Osprey, but for countless other avian and marine species. The Chesapeake Bay is a primary nursery for the Menhaden along the Atlantic. I believe that it is therefore essential for the protection of our coastal ecosystem to take action now to bring about a resurgence in the Menhaden population.

I don't expect the "stewards" of our Chesapeake Bay fishery to act to protect the natural resources based on past performances. However, it is vital to continue to point out the grave consequences of their favoring commercial interests over recreational, forage fish, Osprey and marine mammals that depend on menhaden to survive. This remain obvious to anyone near and on these waters. I urge protection not the continued favor of commercial rape of the bay and nearby waters.

I strongly support the proposed reduction in the menhaden fishery by 50% and the shift to a quota throughout the year with hopes of sustainably managing the menhaden fishery. As stated in the Addendum, there are many reasons why these changes need to be made including to protect the osprey population in the Chesapeake Bay. In addition, reducing the catch and spreading it out across the year should allow the fishery to recover which will have an economic benefit to local communities as well.

I am a New Jersey resident concerned about the health of our coastal ecosystems and the wildlife that depends on them. I urge the Atlantic States Marine Fisheries Commission to adopt a 50% reduction in the Chesapeake Bay menhaden harvest cap and a harvest schedule that shifts more of the allowable catch to the third catch period, giving menhaden more opportunity to grow and remain available as forage for birds, fish, and other wildlife.

I support revisiting these catch limits within (3) three years using the best available scientific information.

Taking a precautionary approach now can help protect the Chesapeake Bay food web and the coastal ecosystems that New Jersey and the neighboring states share.

Thank you for considering my comment.

I am 70 years old and been fishing for 54 years, at my age I seen the best of it, the fishing in Long Island sound has been so bad this year, without the bunkers , the fish migrate thru and they keep going without having the bunkers the season has become a very short season, no bluefish, very few stripers, plenty of sharks, we have to stop the bunker boats, there are no ospreys, I live on the water in Branford harbor, the ospreys are gone, the stripers are plentiful up north, with no bunkers they come thru the western sound and filter to the east, we usually had Great bass, bluefish thru August, now we get to about the Fourth of July, September 13th and we still don't see any fish coming thru to migrate south, without the bunkers they might stay in the ocean and miss the sound.

Let me start by saying I'm not a commercial fisherman.I have 3 waterfront properties in va. I also am a business owner that supports business.I also support doing what's right. Three weeks ago I watched 3 boats without moving from my position net these fish. If omega says there are plenty of fish why do they use airplanes to find them? My property is just east of watt's Island,why go across the bay if fish are plentiful? Perhaps omega could raise fish for there needs in farms. Nah too expensive. Getting to my point now,va.needs to collect revenue from omega for the bay. Perhaps a percentage of fish caught proceeds go to bay cleanup,or to reseed fish taken. No other business gets product for free. Looks like va. is missing the boat on about millions of revenue yearly from omega that could be going to the bay.

With growing concern that Osprey populations along the Eastern seaboard are declining due to a lack of food it is imperative that the Atlantic States Marine Fisheries Commission change the number of menhaden that can be commercially harvested from the Chesapeake Bay. After making a spectacular comeback from DDT, signs of trouble for this indicator species have spread from the Chesapeake Bay to Connecticut with a troubling number of nests failing. As a keystone species, menhaden once swam in schools of billions, but now with numbers depleted, the entire Chesapeake ecosystem could be in trouble. I am asking the Atlantic States Marine Fisheries Commission to reduce the fishery cap by 50% to help ensure enough menhaden remains available for Ospreys and other wildlife. By taking this step, you not only protect the Osprey but the fishery as well. Thank you for your consideration and all that you do to protect our ecosystems.

This year, an Osprey nest that has been successful for years in Westport, CT, failed and was abandoned. This nest was so successful that it would sometimes produce 3 fledglings in a season. For a few years the adult pair would return to the nest on the same day each March. They would be expected on the 23rd. Mentioning these details shows how well established and healthy this pair was. This year, after exhibiting behavior consistent with eggs hatching, food deliveries became less frequent. One day, I witnessed the female adult calling out loudly from the nest resulting in silence from her mate. He simply didn't return with food. What I didn't realize was that this would be the last time I would see her this season. The very next day, the nest was abandoned. Sadly, I suspect chicks perished but the nest is too high to confirm this. This event is shocking, especially after years of success. The same out outcome happened all along coastal Connecticut. These nests have had a major comeback after a decline in the population years ago due to chemical pollutants in the water. To see this outcome again after so much restoration is tragic. To fish Menhaden where they are born is destructive and deadly to the Osprey population's main source of nutrition. Something drastic needs to be done to restore a healthy Menhaden population and soon.

Please remove the commercial menhaden reduction industry fishing from fishing in the Chesapeake Bay. Virginia should be like all states on the east coast and fishing for menhaden should be restricted to 3 miles from the coast and only occur in the ocean. There should be no quota for the Chesapeake Bay. The quota should be for ocean waters where their purse seine nets are meant to be used. I have been in the bay regularly since 2007 and the menhaden have consistently declined as well as other fish and wildlife populations that depend on them for food. Eight ships and 6 spotter planes everyday of the week are decimating the menhaden population.

Today I saw 6 Omega boats come into Reedville. Usually by this time the season has ended because they caught their quota. Now it appears they have no quota and the boats are running continuous threw the fall. Currently Blues and Mackerel are hard to find in the bay where at this time they should be plentiful. I think it is time to SHUTDOWN the whole Omega operation. Keeping it open is not helping Reedville and is more of a boat anchorage holding back Reedville in getting good paying jobs people really want in the hospitality business. Look at Irvington and Weems. We can be just like them. I use to be able to catch decent fish off my dock on the Great Wicomico river but now I'm lucky to catch a small Crocker. Shut Omega down or drastically cut down their quota. 75 percent reduction is more in line.

I believe Omega should be removed from the bay until science can show it isn't causing harm, however I understand it is unlikely to ever happen. As a person whose livelihood depends on a healthy fishery in the bay and along The Atlantic coast I ask that you consider reigning in Omegas ability to wipe out menhaden as they are an essential piece of chain in the ecosystem. Foreign corporations should not be benefiting while harming our waters and the life that depends upon it.

I fully support a 50% reduction in the bay cap on Menhaden fishing and the use of quota periods. A reduction is critical to improving the marine and avian ecosystem in the Bay. Maine has banned industrial Menhaden fishing and the osprey, seal, and bald eagle populations have benefited.

As a transplanted Floridian who has resided in Virginia Beach and fished the Chesapeake Bay for 42 years I distinctly recall the state of the Gulf of Mexico prior to the advent of the net ban back during my teenaged years. The ongoing result there has been the recovery of unlimited fish stocks. Sad to say that for a second time in my 68 year life I have watched the decline happen in the Chesapeake Bay for many of the same reasons I did before. It is my belief that the scientific data with regard to the menhaden struggle speaks for itself, and that common sense with regard to further regulation of harvest is far overdue. Frankly, I miss seeing the whales I used to around Cape Henry, and I pray that my grandchildren may have a chance to catch rockfish like I used to as well. Long foretold is that when you leave fish stocks alone, they can recover expeditiously. Let's get our arms around this matter & move forward. Mark Harrison Virginia Beach

I fully support the 50% reduction in harvest of menhaden for Omega / Cooke. In fact, it should be a permanent ban. While government entities continue to support this atrocious practice, businesses such as mine (fishing guiding) suffer due to depleted stocks of Striped Bass, Redfish, Trout and more that feed on Menhaden. It's gotten so bad, that I've moved my business from the Chesapeake Bay to coastal NC. Stop the madness now. It is long overdue. -Capt. Chris Siess

No one can deny that there are issues with the fish population in the bay! Scientific research needs to be started now, but results will take time. Reducing the amount of menhaden harvested must be put into effect to save all the species that rely on them. Menhaden are such an important feeder fish if there is a decline it's will effect the whole bay. Reduction fisheries argue that there are enough, how can they possibly know that if there hasn't been any scientific study! Please save the bay and reduce the total amount reduction fisheries harvest from the Bay!!!!

As a fishing person and lover of Chesapeake Bay I support the maximum reduction in menhaden removals. Menhaden not only serve as a major food source for many fish in the bay but also for many birds living around the banks of the bay. Omega has the entire ocean to grab their quota. It may cost them a little more but not as much it cost state of md and Va in lost of business. Less menhaden in bay can lead to a down slide on bay activities. Importantly menhaden are filter feeders which can help improve water of the bay

I have lived on the Magothy river since 1960, We would measure Menhaden schools by the acre now the measure by the foot. The east coast is lined with the remains of reduction plants that overfished their area and went out of business. Reedville is the last one.

Please initiate this reduction. There is no question that it is needed. I live on the Patuxent River, and have for 40 years. I can tell you there are less fish, and there are less birds who feed on these fish. This is an easy decision. Please do this,

I have lived in South Bethany, DE for43 years. This summer in South Bethany every osprey nest that in the past was filled with vibrant osprey activity, was empty. If any osprey were seen on the ocean side, they tragically searched for food to no avail. I never saw one bird successfully feed. In addition, there seems to be a lack of bird activity overall. Way fewer pelicans, cormorant and others who also feed on menhaden. Dolphin activity seemed almost non existent as menhaden are also a part of their diet. The ocean seemed silent and void of marine life activity and it is terrifying. Recreational fishing was futile. I also observed an increase in the fish crow activity on song bird feeders… they attacked my purple martins nestlings as surely they are also impacted. Menhaden are critical to our entire marine ecosystem. Please stop this carnage!!!!

Please cap the menhaden catch as much as possible. The exploitation of our waters by these fishing operations is decimating our wildlife. Seeing osprey chicks literally starving to death should be incentive for us as stewards of the environment to put a stop to this.

To the Atlantic States Marine Fisheries Commission,
I am an avid recreational saltwater angler who cares deeply about the future of striped bass and the entire Atlantic coastal ecosystem.
I spend hundreds of hours on the water every year fishing the New England coast. Over the years, I have become increasingly concerned by how difficult it has become to find Atlantic menhaden, commonly known as bunker. I rarely see the large, abundant schools of bunker that I remember seeing in the past. When I do find bunker, it is extremely difficult to find one over four inches. That concerns me greatly because larger menhaden are an important source of forage for striped bass and countless other predators.
Bunker are not just another commercial fishery. They are a critical part of the marine food web and provide food for striped bass, bluefish, tuna, sharks, whales, seabirds, and many other species. Removing large quantities of bunker from the ecosystem removes an important food source from the animals that depend on them.
As someone who spends hundreds of hours on the water, I see firsthand what is happening in our coastal waters. I am not asking for stronger management because I want to see commercial fishermen lose their livelihoods. I am asking because I want there to be enough bunker left in the ecosystem to support all of our fisheries and marine life for generations to come.
I strongly support taking a precautionary approach to Atlantic menhaden management. We need abundant bunker in the water not simply enough bunker remaining to support continued commercial harvest. The health of the entire ecosystem should come before maximizing how many menhaden can be removed.
I urge the ASMFC to support the strongest conservation measures available under Draft Addendum II and to seriously consider additional reductions in menhaden harvest if the science indicates that current removals are putting predators and the broader ecosystem at risk.
If stronger restrictions, including a temporary moratorium on menhaden reduction fishing, are necessary to rebuild bunker abundance and protect the ecosystem, I believe those measures should be seriously considered.
I care deeply about striped bass and the future of recreational fishing. Striped bass anglers should not have to wait until forage populations are depleted before action is taken. We have an opportunity to be proactive now rather than waiting for another fishery to decline and then imposing emergency restrictions or closures on recreational and commercial fishermen.
We need to act now. Protecting the bunker population means protecting striped bass, bluefish, tuna, whales, seabirds, and the countless other species that depend on this essential forage fish.
Please put the long-term health of the Atlantic ecosystem and the future of our fisheries ahead of short-term harvest opportunities. I respectfully ask the Commission to take meaningful action to rebuild and protect Atlantic menhaden populations.
Thank you for considering my comments.

I am a Maryland resident and a birder who spends most weekends photographing wildlife on the Chesapeake and its tributaries. I am writing in support of the strongest options in Draft Addendum II: a 50% reduction in the Chesapeake Bay Reduction Fishery Cap, division of the Bay Cap into three seasonal quota periods, and linking the Bay Cap to the coastwide TAC.

My partner and I have birded and photographed the Chesapeake and its tributaries for years, including regular time on the Patuxent River. Over that period we have watched ospreys work visibly harder to feed themselves and their young — longer hunts, more failed dives, adults returning to the nest with little or nothing. It has gotten worse year over year rather than better. And the ospreys are only the most visible part of it. They sit near the top of a food web that appears to be thinning out beneath them, and when the fish at the base of that system are removed at industrial scale, the consequences do not stay confined to one species.

The science is not ambiguous about the outcome, whatever remains unresolved about the mechanism. In the 2024 breeding season, researchers monitoring 571 nests found osprey in high-salinity areas of the Bay producing an average of 0.51 young per pair, against 1.36 in low-salinity areas well below what the population needs to hold steady. In Mobjack Bay in 2023, 81 pairs produced three live chicks. These are not birds failing to breed. They are birds breeding and then watching their chicks starve.

I understand the reduction industry's position that the Board should wait for further research before acting. But the Chesapeake Bay Cap has been a precautionary measure since it was first created, adopted in response to concerns about localized depletion rather than proof of it. The Commission has acknowledged it cannot currently determine menhaden abundance within the Bay or define what level would be sufficient. That uncertainty is an argument for caution, not for delay. If the Board waits for certainty, it will get it — from the birds, several breeding seasons too late, and the recovery will take decades rather than years.

The seasonal quota period option deserves particular support. Concentrating the reduction harvest in the spring and summer months puts maximum fishing pressure on the Bay precisely when osprey chicks are in the nest and most dependent on a dense, high-calorie forage fish. Spreading the same harvest across three periods costs the fishery little in total tonnage and removes a needless overlap with the most vulnerable weeks of the breeding season. It is the cheapest meaningful thing this Board can do.

I would ask the Board to adopt the 50% reduction, the three-period seasonal distribution, and the TAC linkage together. Ospreys recovered once, from DDT, because managers acted on a clear signal. The signal is clear again.

Thomas Wells
Hyattsville, Maryland

THE EMPEROR BAM HAS NO CLOTHES - BAM IS A FRAUD

The erroneous error for M (natural mortality) that was entered into the Beaufort Assessment Model 2020-2025 instantaneously and miraculously nearly doubled the BAM stock size assessment .The 20% TAC increases soon followed. Nobody at NMFS or ASMFC questioned the absurdity of such an event . Nobody questioned if such an absurdity doubled the stock then another equally absurd error could easily half the stock. Five years and thousands of man hours at hundreds of Board, Committees, meeting , lunches etc, incessant BAM sensitivity runs and such. Nothing and nobody noticed the absurdity of the act. The incessant proclamations coming from ASMFC about how well the menhaden were doing, the endless vapid and equally absurd self “awards” given by ASMFC staff to the staff and the MATH CULT running the hideous mess. To question the veracity of these acts would end any employees career at NMFS or ASMFC and in fisheries management. It took two independent researchers to end this insanity, which wasn’t the first time a huge error went undiscovered for an alarmingly long time. At U. Of Miami Ault et al discovered the error. Aults value for M based on his research was .56 which was roughly half of what ASMFC MATH CULT had entered . This indicated that ASMFC MATH CULT nearly doubled the stock size for five years. This error would have never been picked up by ASMFC or its eighteen commissioners all of which lack the math skills (Masters in Applied Statistics) to even understand how the model allegedly works, not to mention the enormous computer programming skills necessary to design and run and modify the program. THE MUCH foisted BAM model never picked up anything amiss as the endless estimates came spitting out over the five years. World Class grand absurdities.

A new M .92 (remember Ault =.56) was added to the model a 20% change when 50%, .56 was appropriate . A reduction of 50% TAC was in order.
THIS DISGRACE PROVES THAT THE BAM MATHEMATICAL MODEL IS MODELING NOTHING . The Emperor BAM HAS NO CLOTHES.
The TAC for menhaden should be cut in half and left there until an assessment model based on return of species to its range and observation of population densities with fly overs throughout its range can be implemented . Hire the Omega “ Air Force. There were no menhaden in a harbor in the middle of Long Island Sound on Long Island again this year. None I a harbor which would be alive with schools of adults and young of the year for the over fifty years I’ve had a sailboat in the harbor. Even the cormorants have disappeared from our harbor and Port Jefferson Harbor. I remember enormous schools that took a half an hour to pass by along the beaches here . Like our cod fishery , the Math Cult is collapsing the menhaden stock. 7-8 fish in all the frozen bait boxes in the bait and tackle stores here where large adults were always found. . This screams trouble!

Menhaden are too valuable to the whole ecology of the Atlantic fisheries to allow one company to impact this balance. We need to greatly restrict the harvest based on science and not the greed of one corporation.

Biomass of menhaden is at the lowest I've seen in the Chesapeake Bay. I have lived on and fished the rivers and Chesapeake Bay for over 60 years and they are down to very small fish and very small schools for quite a few years and it gets worse every year. Please reduce the Bay Cap as much as possible so they can reproduce. Thx Bill Dunn

I believe a 50% reduction does not go far enough to repair the tremendous damage already caused to the Menhaden stock. There should be a moratorium and “stop loss” implemented until the stock is further assessed and an accurate view of the damage caused by over-fishing is quantified.

Please apply the full 50% reduction on the Chesapeake Bay reduction fishery. Our bay is in deep trouble. There are lots of species that are dependent on menhaden that are struggling and failing to strive due to the lack of menhaden in the bay. The companies that participate in the reduction fishery will try to scare you with we're gonna lose jobs or try to mislead you saying the Atlantic population is fine we do not need a reduction. The truth is, no jobs will be lost because they fish in the ocean all the time now anyway and reducing the bay cap by 50% will still allow them to fish in the bay so I don't understand how jobs will be lost when they're still able to fish. And as far as the Atlantic population, it's a vocabulary game that they're playing. The Atlantic population from Florida to Maine is absolutely abundant and I agree with the population studies that say the Atlantic stock is healthy. There have been no studies done in the Chesapeake Bay. Virginia just approved funding for a study, but it'll be years before it is completed. I have been fishing in the bay over 40 years and I have seen the decline in menhaden as well as many other species of fish and birds. The reduction fishing companies will still be able to employ their people and make their money and operate as normal with a reduced cap. As you are aware, menhaden are a filter feeder and more menhaden in the bay helps clean the water and makes everything else in the bay better. Please apply the full 50% cap on the reduction fishery in the Chesapeake Bay, the livelihood of many charter captains, crabbers, oystermen, and fishermen are dependent upon that. Thank you for your consideration. Craig Freeman

I do not agree with the changes called for in the proposed addendum, and respectfully urge the Commission to reject the proposed addendum. While there is a lot of extreme advocacy by the Chesapeake Bay Foundation, the Chesapeake Legal Alliance, and the charter boat industry making unsupported claims, there is no scientific evidence that the menhaden population in the Chesapeake Bay is diminished, and in fact surveys show that there are more menhaden in the Bay now than there were in the 1970's. While there is a diminishment of the striper population in the Bay, there is not any scientific evidence that that is due to a diminishment of the menhaden population in the Bay. Instead, there is hard evidence that both commercial and recreational overfishing of the stripers in the Bay is the primary cause of the diminishment of the striper population in the Bay. Similarly, while there is anectodotal evidence of a reduction of osprey chicks in the Bay region, there is no scientific evidence that that this phenomenon has anything to do with any diminishment of the population of menhaden in the Bay. The state of Virginia has now funded and commenced a scientific study of the population of menhaden in the Bay. The ASFMC should not make any changes in the current menhaden fishery cap or other menhaden fishing-related restrictions until the results of that scientific study are known, and unless and until hard scientific evidence exists showing a diminishment in the menhaden population of the Bay.

Maximize protections of menhaden for the long term health of the Bay and the other fish species that depend on menhaden for food. Better to be proactive than reactive, even if it means a conservative approach!

Name

Ryan Simons

Email

chaosisd@gmail.com

State

Pennsylvania

Comment

My name is Ryan Simons. I live in south-central Pennsylvania, where our creeks run to the Potomac and then to the Chesapeake Bay. I grew up on the eastern shore and spend my weekends as near or on the water as possible. I worked for DOI for over 16 years now. I am writing as a private citizen. I want a healthy Bay and a working Reedville, and I think you can protect both.

THE PROBLEM IN PLAIN TERMS

Menhaden are small, oily fish that almost everything in the Bay eats. This year, ospreys in the saltier parts of the Bay raised about one chick for every four nests. They need roughly one chick per nest just to hold steady. Four out of five pairs raised no chicks at all. Researchers say the chicks are starving.

Nobody has proven the menhaden fishing fleet caused this. The scientists themselves say it could be warming water, fishing, or

fish arriving later than they used to. But waiting for proof has a cost. A catch limit can be raised again in three years. A crashed osprey population cannot be brought back by a vote.

WHAT I AM ASKING FOR, AND WHY

1. Cut the amount the large fishing fleet can take inside the Bay in half, to about 56 million pounds a year. (Section 3.1, Option C, sub-option C1e)

Why: This limit only covers fishing inside the Bay. The fleet can still catch those fish in the ocean, so its total catch does not have to drop. Also, the fleet has caught less than the current limit almost every year. A small cut may change nothing on the water.

2. Tie the Bay limit to the coastwide limit, so they rise and fall together. (Option C)

Why: Last year you cut the coastwide limit by 20% but left the Bay limit alone. That let a bigger share of the catch come out of the Bay, the nursery, at the worst possible time.

3. Set a floor of about 56 million pounds that the Bay limit cannot drop below. (Sub-option C2b)

Why: The crews and the plant in Reedville need to plan. A floor tells them the worst case up front. Fair rules should be predictable for the people who live under them.

4. Spread the catch across the season: one quarter in spring, one quarter in summer, one half in fall. (Section 3.2.1, Option B2)

Why: Ospreys feed their chicks from April through June and cannot change that schedule. In 2023 and 2024, more than half of the Bay catch came out in just six weeks of midsummer. Maryland pound-net fishermen saw their catch fall 60% in 2024. Your own document says timing changes cost the industry far less than cuts to the total.

5. If the fleet goes over in one part of the season, subtract it from that same part next year. (Section 3.2.2, Option B)

Why: A limit with no consequence is only a suggestion.

6. Review all of this every three years. (Section 3.3, Option B)

Why: Virginia just funded a $2 million study of menhaden in the Bay. In three years you will have real numbers. If they show the fleet is not the problem, raise the limit. I will support that.

TWO MORE REQUESTS

Publish the total Bay catch each year. Right now it is kept confidential, so the public cannot tell what any limit really does.

Take the Virginia report on worker impacts as seriously as the osprey counts. One estimate ties about 54 fishing jobs to a cut this size, and the study behind it says that is likely too high. Those families deserve a plan, not blame.

THE BOTTOM LINE

Fish left in the Bay this spring can still be caught in the ocean this fall. Chicks that starve this spring are gone. When you are

not sure, choose the mistake you can fix.

Thank you for your time.

PLEASE reduce the quota for Omega fisheries for menhaden. This is disrupting the Ches. Bay fish and birds and other wildlife. We go fishing out of Deale and can hardly even find spot and perch anymore much less a larger fish like rock, blue and trout.

It's disgusting to let such a beautiful and important species die out just for the sake of some fishery. The business can work around to find another means to keep profits, the bird however, cannot work around to survive when their needs for basic survival are stolen from them. In 20-30 years people will care far more for these animals than some obscure fish business.

If the menhaden fish catch at the Reedville, VA location is to be reduced, the result for the business, the employees, and the community would be impacted in a negative way. I personally work for a company based in Ohio that has manufactured process equipment for the Omega Proteins facility in Reedville. We have been doing business with Omega Proteins since 2007. We have spent many months throughout the years installing and maintaining said equipment, contributing to the local economy through our patronage at local hotels, restaurants, and various other businesses. If the fish catch is to be reduced, our services will likely become more infrequently required thus impacting the local businesses that we would otherwise be supporting while in the area performing work at this facility.

Thank you for your time and consideration.

To whom it may concern, this letter is in reference to the upcoming decisions on reducing the menhaden catch in the Chesapeake and related Waters. As a long-term resident of the state of Maryland and an avid fisherman and user of our great natural resources,I am absolutely appalled at the recent reduction in the Osprey population. As you well know, there's been a decline of at least 14% of the adult population in Maryland in the last year and a massive loss of osprey fledglings in the last two years that can be directly tied to the drastic reduction of the menhaden population. Almost all this is due to the overfishing by the Omega Protein company of Virginia, whose corporate ownership is Cooke Inc. of Canada. It is incomprehensible that we are allowing a foreign owned company to decimate our bay population of fish like the menhaden .You can only imagine if a foreign company came in and started over harvesting our beloved Chesapeake Bay blue crabs, there would be a massive out cry and intense public outrage . I would prefer a full and complete industrial closure of the fishery, but since that does not seem to be on the table I'm in total support for at least a 50% reduction in the total catch. This has to be instituted immediately if we expect to see any improvement in the total osprey fledglings in the next few years and for other important bay inhabitants. Please make the correct and only decision by reducing the catch immediately. Thank you for your consideration, Robert Etter DVM.

I have lived in the Chesapeake watershed since 1985 and am a long-time boater. I am also a member of the Magothy River Association and have been actively involved in monitoring water quality and bay grasses which provide habitat for yellow perch, oysters, crabs and other bay species. I am deeply concerned about the reduction in Osprey and other aquatic birds, especially because they are indicators of a potential decline in bay health and productivity. It is clear that menhaden provide the bulk of the food source for many aquatic species in the Bay and along the Atlantic coast. This is due to their unique fatty acid profile and protein content. However, recent data suggest that the size and age class of the fish caught in recent years are decreasing which is a population dynamic that will lead to a crash in Menhaden numbers. This is not a new concept or speculation. If this occurs, then osprey and all the other species that rely on menhaden will endure severe population decline. I am totally in favor of an immediate 50% across the board coast-wide and bay-wide reduction in the commercial harvest. To continue the harvest of this public resource it should be up to the commercial fishery to prove that they are neither harming the future menhaden population, nor health of the aquatic life that depend on menhaden, including ospreys.

I have been sailing the Chesapeake Bay out of the West River for a number of years. Osprey typically nested on 3 of the channel markers in the river and generally 2 would result in fledglings. During the past 4 years, this pattern has changed, first with a nest no longer being built on one of the markers and another not yielding chicks to now only one on which a nest is built but not yield chicks.

I realize that a number of factors can be the cause of this trend. But at the same time, menhaden bait fishermen have notice a decline in their catches and osprey elsewhere in the Chesapeake watershed that do not depend on menhaden as a food source are nesting successfully. Until NOAA completes its menhaden fisheries study as authorized by Congress, out of an abundance of caution, it would seem reasonable to impose a reduction in the limit for the reduction within the Chesapeake Bay. While there would be an impact to the commercial fishery in terms of input costs, there remains sufficient stocks outside the Bay for them to meet their market goals.

I run a charter out of both Norwalk CT and Hampton Bays NY. Over the last three years, I have seen the presence of adult menhaden diminish to almost nothing. I still see some menhaden off the south shore of Long Island, but nothing like I did five years ago. What is more concerning is that I don't see any adult menhaden at all in the Long Island Sound off the coast of Norwalk. In decades past, there were large schools of adult menhaden all of which were about 9-12 inches long. It was nothing to plan a day of finding a school of menhaden, snagging a dozen for bait and fishing the rest of the day for stripers and blues. In the past three seasons, I have not snagged a single menhaden. Smaller fish have been in the estuaries and have been catchable with cast-net or gill-net, but even that is getting harder and harder to accomplish. I have noticed this season that we catch more stripers and blues on small profile artificials rather than large ones, because matching the hatch no longer means matching an adult menhaden. There are none! Something is very wrong. Whatever science you're using, it is flawed. Our bluefish, striped bass, tuna and countless bird species are all going to suffer. Not to mention charter captains.

We live in Virginia just off the Bay at the mouth of " Chisman Creek ". For past 20 years we've watched our Osprey nest closely every year. Its the highlight of our spring watching the Osprey return and start working on the nest. Past 6 years no chicks made it to fledge. Last year none even hatched, this year the Osprey didn't even show at our nest, 1st time in 20 years living here. I'm hearing and reading the same from many people, the chicks aren't making it to fledglings. Yes, the osprey are still here but they don't seem to be thriving as they once where. We do have some Eagles but always have, yes Osprey and Eagles have always fought. Now all of a sudden did the Osprey move on somewhere else or are slowly dying off. Hearing similar stories from so many people on the Bay, I'm thinking the later. Somethings very off. As a recreational fisherman I see the Omega vessels a few times a year and watch the operation. In my opinion Omega should be stopped for a number of years to see if the Osprey can bounce back. The Menhaden is CRITICAL to our Chesapeake Bay. Please stop Omega for a period of time ! They do it all the time to recreational fisherman on certain species. Thank you ~ Kevin Earley 757 870 2980

As an avid sailer and occasional recreational fisher in the Chesapeake Bay, I am troubled by the overfishing of Menhaden, the feeder fish at the bottom of the food chain that support a healthy marine life ecosystem in the Bay and its rivers. The numbers being taken from the Chesapeak are decimating & all of the fishing is controlled by a single company owned by a Canadian enterprise using planes & large vessels to scrape life from the Bay. A healthy Chesapeake Bay means a healthy region in the ocean and on land. We cannot reverse the damage that has already been done, but we can put much stricter limits based on real science on the over-fishing by a foreign corporation.

I support all efforts to reduce the catch of menhaden for commercial purposes. I live on the West River in Anne Arundel County. As recently as five years ago, we had approximately 10 osprey nests on our portion of the River. Now we are down to one and it has failed to produce offspring for three seasons in a row. We have an osprey crisis that can't be ignored. I am also a fisherman and have experienced dramatic decreases in rockfish.

Omega claims that it is impossible to draw a correlation between their haul of menhaden and the decline of rockfish and ospreys. But there is no doubt that there is a severe crisis. I support all proposals to reduce the harvesting of menhaden until we can develop more scientific studies that directly trace the causality.

This is an emergency.

Sincerely,

Robert Ottenhoff

Osprey populations are in peril likely due to starvation from lack of available food. By capping the amount of Menhaden, a primary food source for Osprey, we will give them an opportunity to rebound. Osprey are crucial to their environment and ecosystems and the loss of them would have cascading effects on other parts of the ecosystem. As someone who is a scientist and avid birder, the loss of Osprey would be devastating. Please cap the amount of Menhaden in order to give them a fighting chance at recovery.

Please cut the commercial menhaden harvest limits by at least 50%. Most marine life in the Chesapeake Bay depend on healthy stocks of menhaden and the fish simply are no longer available due to overharvesting.

As someone who has visited the Eastern shore of Maryland every year for the past 50 years and enjoyed all that the Chesapeake Bay has to offer, especially watching the osprey, build nests, protect them and raise their chicks, I urge the ASMFC to approve conservation-minded reforms that better protect menhaden and support a healthy Chesapeake Bay ecosystem, including reducing the Bay Cap by 50 percent in 2027 and implementing quota periods to more effectively distribute reduction fishing pressure throughout the season. I remember how polluted the Bay was before conservation efforts began.
Please support the following options in Draft Addendum II:
• 3.1 Chesapeake Bay Reduction Fishery Cap Amount: Support option C1e that would reduce the Bay Cap by 50 percent and limits it to 13.6 percent of the Coastwide Catch Limit (TAC). Also, support option C2a which sets an upper limit of 51,000mt for the Bay Cap, which is the current level.
• 3.2 Chesapeake Bay Cap Distribution: Support option B2 which establishes three even length quota periods for the Bay Cap, but distributes harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. Also, support option B which establishes quota period overage payback and rollover of unused quota within a fishing year.
• 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: Support option B Revisit Provision to reassess the efficacy of these new management tools every 3 years.

Dear Commissioners, My family owns a home on St. Patrick's Creek in Colton's Point, Maryland. St. Patrick's Creek feeds into the Potomac about 30 miles north of the Chesapeake Bay. I am very concerned about the overfishing of menhaden in the Chesapeake Bay. I understand that a Canadian company that produces supplements for pets is responsible for most of the overfishing. I also understand that the overfishing of menhaden is the reason that my family has seen many fewer osprey on St. Patrick's Creek. The Chesapeake Bay is precious and I am very much opposed to large commercial fishing enterprises interfering with the ecosystem. Please adopt Draft Addendum II. Thank you for your consideration.

I live at 1 Beach 105th Street, Rockaway Park NY 11694. Five years ago we noticed every night lights from small boats less than a mile off the Atlantic Ocean by our apartment complex. Some nights they're 3 - 4 boats, last week 5 boats could be seen. They show up at dark and leave right before sunrise back to NJ. I advised this to a NYPD Harbor crew having breakfast at a local waterfront restaurant and they told me to contact NY State Dept of Environmental Conservation. I sent them an email 5 years ago as I was concerned that these boats are fishing under cover of dark for Menhaden. I asked that they investigate. I never received a reply from them and no action was taken as this is still continuing 5 years later. These boats anchor in the ocean between 105th and 109th Street.

Get in Touch

I'm concerned with the lack of data on menhaden population and the status showing they are not being "over fished". Evidence of a declining osprey population points to issues with overfishing.

Draft Addendum II addresses actions to be taken now that will allow for the rebuilding of the menhaden numbers and benefiting the Chesapeake community at large. Failure to do so will shorten the future of the menhaden industry along with a dire impact on our bay.

Thank you for your support of The Chesapeake Bay ecosystem.

Sincerely,
Anne Betz

Gentlemen: My name is Dr. Francis E. Baker, Jr. I live in Chesapeake Beach, Maryland on the bay, and I have fished and hunted on the bay for 60+ years. I see, first hand, what is happening to the menhaden and its effect on the detrimental affects fishing and hunting. I am deeply concerned about the difficulty in getting the Menhaden fisheries annual limits lowered to further protect them and over the years to secure long term survival of menhaden populations and survival of the trophy rock fish (& other species dependent on menhaden) and the Osprey populations (including chick survival). Protecting the menhaden is one of the limited ways, we can help with the struggling menhaden population and CB estuary. Please add my signature and state to the Chesapeake Bay Foundation's comment letter on Draft Addendum II. We desperately need positive action to be taken at this time. Thank you for your service and all that ASMFC does.
Sincerely,
Francis E. Baker, Jr PhD, PE

Adult bunker have been absent from Long Island Sound for two years straight. I mean virtually completely absent. I have fished Western LI Sound out of Mamaroneck continuously since 1994. For most of those 30 years, the Sound was chock full of bunker. In August, in the Western Sound, the harbors would be so jammed with bunker that they'd deplete all the oxygen and they'd suffocate, creating massive smelly fish kills. Those days are certainly gone. This year, no bunker showed up on the South Shore of Long Island either. The situation is worth in the Chesapeake. And when I fish in the Mississippi River delta, the schools there are far reduced. Bunker are the prime forage fish for so many of our critical coastal fish, mammals, and birds. The stripers, red fish, sea gulls, osprey, whales, porpoises all depend on the massive schools which no longer exist. Why? Because one single company is allowed to slaughter a gigantic percentage of the biomass - a Canadian-owned company no less. Omega Proteins operates the only bunker reduction fleet on a giant industrial scale and is single-handedly destroying the bunker schools - which in turn, is threatening the striped bass, red fish, and osprey populations in particular. I have personally witnessed both the slaughter and the depleted wildlife situation.

It borders on criminal the irresponsible actions of ASMFC that for decades allows this unmitigated debacle to occur unchecked. It's truly remarkable that you Commissioners fail at virtually everything you touch. You ignore science and reality

and are political pawns. You react like molasses. Now you have a chance to take remedial action - too little and too late - but do the 50 percent reduction now. Maybe you'll sleep better at night.

Pioneer Vallery Boat & Surf Fishing Club supports better coastwise management of Atlantic Menhaden:

Also referred to as the "most important fish in the sea", the Atlantic Menhaden are an iconic, keystone species who play a major role in holding up the aquatic ecosystem of the Bay. There are concerns of overfishing of these small, oily fish and a reduction in the allowable catch in the Chesapeake Bay is required. Osprey, which are relying on menhaden, are experiencing unprecedented nesting failures in the areas of the Bay with high salinity. Allowing more menhaden to be available to the Bay ecosystem promotes the productivity of this estuary amid the impacts of climate change, pollution, and development.

As a biologist who grew up on the Poquoson, York and Piankatank Rivers and the Chesapeake Bay, I have seen firsthand, the damage done by overfishing menhaden.
We've had a camera on an osprey nest for a couple of years now. This year, I watched in horror as starving osprey chicks were plucked from their nest by a predator. The chicks were left alone while their mother hunted for fish, because the male osprey had experienced increasing difficulty returning with a catch. Early in the season, he would return with sufficient fish. I was so excited to see the shells pip and the chicks be born, but no meals were forthcoming. By early May, he was spending more time hunting with lesser results and leaving the nest unprotected. It was devastating to watch the two osprey parents diligently attend their duties for months on end, she on the nest incubating through blazing sun and wind-whipped storms, he providing fish and running off predators from his guard post in a nearby tree, only to end in tragedy. Baby chicks have to eat right away and frequently. No meals came. Those birds were skilled and working as hard as they could, but could not provide food for their young.
Additionally, over the years I have watched crabs get smaller and fewer and striped bass populations decline. You can't just remove a huge portion of the food base and expect everything to just work out. The overfishing of this critical resource has occurred partly because the damage is difficult to see. If these were bison, unobscured by water, the evidence would be more clear. This has allowed advantage to be taken.

Finally, the resources of the Chesapeake Bay belong to the citizens, not the government and not corporations. For too long, corporate greed and political donations have determined the fate of the Bay. I hope a new day is dawning.
I support limits on menhaden fishing and appreciate efforts to improve the health of the bay, as it affects us all.

I am disheartened to hear a recent report by the Connecticut Audubon society that success of Osprey chicks is at 0.87 chicks per breeding pair this year. Down from 1.26 (another low) in 2025.

I love watching the osprey at my local pond and along the Connecticut River. It is clear that there is a crisis in their food source and that menhaden need to be protected. I join Connecticut Audubon in urging the ASMFC to reduce the fishery cap by 50%, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for osprey, are not put in even greater jeopardy. There are so many stressors on these birds and fish from a warming world to more intense storms to further habitat reduction.

I see the importance in letting the menhaden population recover and agree with this measure. For too long we have let companies and economic growth dictate what is "good" for us. I am tired of that and want to see balance return to the world.

Thank you,
Andrew

Menhaden Addendum II
Providing input regarding menhaden stocks in Madison and Clinton coastal areas. 2025 and 2026 menhaden schools were very low and I personally observed 12 Osprey nests with 1 or no fledgling. I ask that commercial fishing for the vital menhaden in the Chesapeake be drastically reduced to properly assess the impact on the food chain.
Kind regards
George Giles

The overfishing of menhaden, in Virginia, which is the only state who allows inshore fishing, must end! I don't mean it needs to be regulated. It must be stopped! the predator fish that feed on Menhaden are going away, the ospreys who need to Menhadn for their chicks are dying, they have regulated rod and real fisherman to one fish per day, and yet giant menhaden ships are allowed to catch and keep tons, not to mention the by-catch, which they are also allowed to keep and process. stop this insanity, why does every other state see this threat to the chesapeake bay but Virginia does not? keep them out of virgina waters and our bay might recover

This particular type of fishing has been ecologically wrong and illogical from the beginning. Menhaden are being obliterated by the "INDUSTRIAL" style of fishing practices. The massive 'scooping' up of fish using those ominous nets is decimating them! Menhaden are CRUCIAL to so many other species' survival! END this practice now! Sustainability is paramount. The OVERFISHING of menhaden is OBVIOUS. As a kid these 'bait fish' were everywhere on our shorelines. And they were about 10" long!!! Now they are barely 5" long and the bait stores in my area were OUT OF STOCK this season. Our local WMA had only 1 osprey fledgeling out of 17 and FB had numerous posts from organizations mentioning the similar outcomes of osprey nests from other areas. This is SERIOUS stuff. Don't let Big Industry dictate rules! This situation shouldn't be about economics as they would complain about. This predicament requires SCIENCE and the implementing of SUSTAINABLE procedures. Nature is bountiful! But humans have a tendency to to think our world's resources are infinite. Thank you for your time. GO MENHADEN!!!!!!!!!
Sincerely, Lisa Innarella

Atlantic States Marine Fisheries Commission (ASMFC

Dear Members:

I am writing as a St. Mary's County Maryland resident who purchased property on the St. Mary's River in 2000 which has become our residence and which we have developed a deep personal connection to the Chesapeake Bay. My wife and I are lifelong Marylanders, avid crabbers, boaters and conservationists who spends considerable time on and around the Bay. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base.

Observation on the St. Mary's River

Living on the St. Mary's River, directly across from St. Mary's College of Maryland., we have seen a significant decline in the

fish population in the river especially in the last several years. We used to catch several croakers, perch and strippers from our dock daily, but in the last couple of years not so much to the point now it seems they don't exist. We used to see the Menhaden in large schools on the river throughout the spring through fall but the past couple of years the number of schools and their magnitude have significantly declined and now really don't seem present any longer.

Our underwater green light used to observe fish at night, at the end of our dock, lights up after dark which up to four years ago we would have hundreds of small stripers 10"-16" swimming counterclockwise around the light. Three years ago, there were puppy drum swimming clockwise in the hundreds around the light. Last year we saw verry few fish swimming around the light and very few when the light stopped working this past May. This year we caught a 19" striper in the spring, two small stripers in the summer and none so far this fall, The abondance of perch have disappeared to the point of nonexistence it seems. For now, the only fish which seems present are these puffer fish which are present. We never caught these before in the 25 years we owned and fished off the property here.

Another observation is that the Osprey and their nests are not present as they have been in the past. We had several blue herons a couple of years ago, but we have seen only one which is still present lately. Rarely now we see the bald eagles, I have seen only one which on occasion flies over the river a couple times this summer. They were often seen daily a couple of years ago. The seagulls were light in numbers this spring though July, but in August they were more plentiful until now they again disappeared a couple of weeks ago.

We live on this river every day and have observed the decline in the natural conditions and have had discussions with our neighbors and watermen friends as to what's the cause. In thinking about it, the lack of the masses of schools of Menhaden which use to swim in this river may be part of the problem.

The question remains, why has there been such a serious change, is there a cause to this change and how to look for a path for a remedy. What can we do?

Until we can find answers to the cause, I strongly support the recommendation in reducing the Chesapeake Bay reduction-fishery cap by 50 percent—from 51,000 metric tons to 25,500 metric tons per year, establishing strict seasonal quota periods for menhaden and an independent audit to certify the quota is being followed. The Chesapeake Bay is too important, and the ecological warning signs are too serious, to continue managing this critical forage fish as though the timing and location of harvest do not matter.

Be advised that we are seeing warning signs that should demand a precautionary response. Declining productivity, widespread osprey nest failures, and continuing concerns regarding the Chesapeake Bay striped bass population are not isolated issues. They are reasons to examine carefully whether we are removing too much forage from the Bay at the wrong time.

It's clear to us that the Menhaden are a foundational forage species. They feed an extraordinary range of predators, including striped bass and osprey. Yet the reduction fishery can remove more than 100 million pounds of menhaden from Chesapeake Bay under the existing annual cap. When a substantial portion of that harvest is concentrated into an intense summer fishing window, the issue is not simply how many fish are removed annually. It is when and where those fish are removed.

A menhaden harvested from a concentrated school in the Bay during the summer is no longer available to the predators that depend upon that school. Concentrated removal can create localized depletion during a biologically important period and can affect the availability of forage to other users of this shared public resource.

The consequences extend beyond the reduction fishery. Menhaden support the Bay's recreational fishing economy, commercial and charter fishermen, watermen, wildlife, and coastal tourism. One user group should not be permitted to concentrate an enormous harvest of a shared forage resource during the period when that resource is most important to the rest of the ecosystem and to other Bay users.

For that reason, I urge the Commission to take the following actions:

• Reduce the Chesapeake Bay reduction-fishery cap by 50 percent to 25,500 metric tons annually.
• Establish strict seasonal quota periods that distribute harvest throughout the year rather than permitting an intense summer harvest.
• Apply a precautionary management approach in light of uncertainty regarding localized menhaden abundance and the ecological condition of the Chesapeake Bay.
• Give greater consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the broader Chesapeake Bay economy.

The Chesapeake Bay is not simply a location on a fisheries-management map. It is a complex and interconnected ecosystem, and menhaden are one of its essential links.

We should not wait for further deterioration before taking action.

We live here trying to enjoy, crabbing, fishing, boating, kayaking and swimming in these waters and, we care deeply about the wildlife and natural conditions that they depend on. I believe the Commission has an obligation to manage menhaden conservatively and to recognize that the health of the Bay must take precedence over maximizing a concentrated industrial harvest.
Reduce the cap. Establish meaningful seasonal quotas. Protect the forage base. Give the Chesapeake Bay—and the people and wildlife that depend upon it—a greater margin for recovery.

Thank you for considering our comments.
Sincerely,

David Reumont

I am writing to express my strong support for maximizing the conservation measures outlined in Draft Addendum II to Amendment 3. Atlantic menhaden serve as the foundational forage fish for our entire coastal ecosystem, sustaining iconic fish, marine mammals and birds.

I urge the Board to adopt the most protective options available:

1. Reduce the Chesapeake Bay Reduction Fishery Cap by the full 50%.
2. Create structured, seasonal quota periods to eliminate concentrated industrial effort during key summer breeding windows.
3. Mathematically link the Bay Cap to the coastwide TAC to ensure localized safeguards remain proportional to broader population health.

I further urge that my home state of New Jersey take the strongest position possible in reducing or eliminating menhaden harvest along our coast.

We cannot afford to delay action until "perfect science" is available when clear ecological warning signs like starving osprey

and even the fisheries reporting smaller/scarcer catch demand precautionary management now.

Atlantic Menhaden Draft Addendum II
Do we as the human race really need to push a fish species to the brink? Yet another starvation year for the Osprey population. Your outdated data set is driving this antiquated short sighted single remaining harvester to drive the menhaden to collapse. Go to the bay and have a look for yourself, please! Just as we have seen the the end of the commercial sailing vessel and the whale oil trade I believe we are witnessing the the same with the reduction fishery in the Bay. If the will of the state is to support the last of what remains of the fish oil harvesters, then too the will of the state can help the 500 or so workers transition. Lets achieve the 50% reduction with the goal of a final closure. Kindest Regards David B. Lenz

I believe the menhaden catch for the reduction industry should be reduced further than the current plan of 20%. I favor a 50% reduction until we have better science to set a sustainable limit. I live on a creek that feeds the Potomac river and have seen first hand the decline in rockfish and other species that depend on the menhaden as a food source. I feel for the livelihood of the watermen who crew the reduction boats but we cannot destroy the health of our nations largest estuary by overfishing a critical species like the menhaden to make protein for pet food.

We need major reductions in the Atlantic Menhaden fishery, especially the Reduction fishery, as Menhaden are an integral, if not the keystone organism with the food web falling apart as so many species depend on the biomass of menhaden. From fish, mammals (seals, whales, etc), birds, and more numerous species depend on juvenile to adult menhaden for their survival and their progeny's survival. If you look at just one species, osprey, the young of the year have declined dramatically as other prey items (fluke, weakfish, striped bass, etc) do not carry the fat content to allow juvenile osprey to successfully fledge to adulthood. They are the proverbial "canary in the coal mine" - please enact major reductions to promote restoration of our Atlantic Menhaden.

Sincerely,

Capt. Brett Taylor (charter captain and public school science teacher)

I am a resident of Irvington Virginia in the Northern Neck. I routinely see the boats from Reedville, mostly owned by a Canadian company working the waters of the Chesapeake Bay and the Rappahannock River. I am also aware that in the last three years we have had no ospreys nesting on our nesting platform, they have become a rare sighting, and we have had a harder and harder time catching fish from our little boat. I have talked to Maryland fishermen who say there are not enough menhaden to bait their traps. I believe menhaden are being overfished in the Chesapeake Bay. I would like to see a moratorium on fishing for menhaden in the Chesapeake Bay - keeping the fishery out of the Bay and out in the ocean. And I think this is a matter of some urgency. Of the options offered now I would like to support the following:

I support option C1e that would reduce the Bay Cap by 50 percent and limit it to 13.6 percent of the Coastwide Catch Limit. I also support option C2a which sets an upper limit of of 51,000mt for the Bay Cap, which is the Current level.
I support Option B2 which establishes three even length quota periods for the Bay Cap, but distributes harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. I also support Option B which establishes quota period overage payback and rollover of unused quota within a fishing year. I also support option B to Revisit the efficacy of these new management tools every 3 years.

Respectfully submitted, Jane Wells

This past osprey season I notice a decline in the number of ospreys and their chicks. The nest I monitor had maybe one chick and the other one had a chick fall out. Also notice lack of bunker fish as a food source while out fishing this summer. Not many had success when diving for a fish. Long Island sound is going through some changes as the water warms and other species of fish are now using the sound as a food source. The osprey do not have a chance.

Dear Commissioners:
I work in the menhaden industry in Virginia's Northern Neck region, and my job depends on its future. This fishery has kept people working here for well over a century. It supports workers, their families, and our community. I am worried that what the Atlantic Menhaden Board is considering in Addendum II could put Omega Protein, Ocean Harvesters, and our jobs at risk. That would hit me and my community hard. I am asking you, from the heart, to reject further cuts to the Bay cap and mandatory seasonal allocations.

When the Bay cap was put on us in 2006, we were told it was only a "precautionary" measure. It was supposed to keep our fishery from growing in the Chesapeake Bay while scientists studied whether our fishing affected striped bass. That question still has not been answered with new science, but the cap was cut by more than half.

Today, we are probably fishing at the lowest levels since the 1800s. There used to be many plants and dozens of vessels fishing the Bay. We caught three times as much menhaden in the 1980s and 1990s, and striped bass still recovered.

There are now millions of dollars from Virginia and the federal government to pay for the research the Board says it needs. If

the Board says it needs the science, then let the science get done. Cutting the cap again before the results are in would do nothing but hurt the reduction fishery. We have already done more than our share to help keep the Chesapeake Bay healthy, and we are glad to do our part. We need a productive Bay and a sustainable menhaden fishery as much as anyone. The cap should not change before the science is done.

We need access to the Bay. In the last few years, rough weather offshore has cost us a lot of fishing days. We find menhaden by sight. When the ocean is rough, we cannot see the fish or catch enough to keep the plant running. Fishing in the Bay is safer, costs less in diesel, and gets us home sooner.

We hear plenty about ospreys and the trouble Maryland pound-net fishermen are having catching fish. Ospreys are not doing well, but the Board needs to remember that menhaden migrate and have been showing up later than usual. We are not fishing when the earliest chicks starve. We are not fishing when ospreys first arrive and lay eggs, either. At that time, there is no reduction fishing in the Bay.

We know osprey are not picky. They will eat any fish they can catch, and it looks like they are not finding fish at all. The same goes for pound nets. When the pogies come close to shore, the nets catch them. Why isn't the Commission looking harder at the environment, especially when we keep setting heat records summer after summer? We are catching menhaden in the Bay, so the fish are there. They just seem to be staying away from the nearshore areas where pound nets are set and ospreys hunt.

That is why forcing Virginia to divide up the cap into "seasons" will not fix any proven problem. The reduction and bait fisheries have worked side by side for generations. We catch only a fraction of the menhaden in the Bay. If we were hurting the bait fishery, we would have seen it decades ago. Even the Board's own scientists found higher Maryland catch rates in 2023 when we started late, and lower ones in 2024. That tells me something else is going on.

We have to fish when the pogies are here. The seasonal options would force our boats to catch more than ever before in fall and early winter, right in the middle of storm season. Meanwhile, the boats and the plant would sit idle during good summer months, when there are plenty of pogies for everyone to catch. For the people on the boats and at the plant, this is not just a rule on paper. It could threaten our operations and jobs without any proven biological benefit.

Please reject these measures and let the new Bay-specific research answer the questions the Commission itself has raised. Our jobs and our community matter, too. If these rules cost jobs and damage our community without fixing the pound-net, osprey, or striped bass problems, that damage will not be undone for workers and their families.

Dear commissioner,
I urge you to place a 50% reduction in the Chesapeake Bay industrial Manhaden harvest cap to help protect osprey from food shortages and chick starvation. Manhaden are a critical food source for breeding osprey that have to feed their young. Without the adequate numbers of the fish, chicks starve in their nest. 2026 was the lowest breeding season to date in the Chesapeake Bay. We must reduce the cap to protect this magnificent species from extinction.

I have been interested in conservation since I was a child and something that has always stuck with me is that the health of the top of the food chain is an indicator of the health of the ecosystem. I watch for hawks, coyotes, bear, all of the top predators.

Reading that one of our top state predators is struggling tremendously throes all the red flags up
Let's makes the changes needed now instead of waiting until we are trying to reintroduce the species that is no longer there.

As a frequent recreational fisherman in the coastal waters from CapyMay to longbeach Island, I have seen a drastic reduction in the overall population of bunker over the last 6 years. The menhaden schools when they can be found are significantly smaller in both quantity of fish and size of the actual fish.

I am happy for the Maryland fishery that the commercial catch has been reduced to improve the quality and quantity of available bait fish to support the food chain for predator species. I do hope that regulations for the rest of the East coast follow soon as the fleet has just moved to new grounds and are decimating the stocks in coastal New Jersey waters.

We need to stop commercial fishing in the Chesapeake Bay! This is truely devastating. I go to the beach approx 4 days a week in the summer as I live nearby and this was the first yr ever to see an osprey hunting along the beach. It made me sad to see this as I have recently been made aware of their dire situation. Virginia must stop the foreign companies from fishing and drone spotting before it's too late . Thank you !

The fish of the Chesapeake Bay are an important food source for the Osprey. Based on the the CT Audubon's data, the Osprey had the worst breeding season (2026) in recorded history. The Osprey need a food source to be able to breed successfully and they are already at high risk. Biodiversity in our ecosystem is incredibly important for nature to thrive and the Osprey are an important part of that.

Please save the Osprey.

Thank you

As an avid, local inshore fisherman, having a foreign-owned company completely decimate schools of critically important forage fish is at best disheartening and at worst disgusting.

Regardless of what the numbers and data say (I'm not going to pretend I know), does the current practice feel right? Spotter planes, massive nets, big crews on big boats. The menhaden don't stand a chance. Neither do the predator fish swimming in and around the menhaden just trying to eat to survive. It's not fishing. It's just taking. It's selfish.

Non-tidal wetlands are protected. Stream buffers can't be touched. Stormwater runoff water quality requirements have never been so stringent. The Bay is actually getting cleaner. The fish should be thriving. But they're not.

Why is this allowed to continue?

"Take what you need and leave the rest."

I support reducing the initial Chesapeake Bay Cap by 50%, from 51,000 to 25,500 metric tons.
Establishing the Bay Cap at 13.6% of the coastwide total allowable catch so it can adjust when the coastwide quota changes.
Maintaining 51,000 metric tons as the maximum Bay Cap, with no fixed lower limit.
Allocating 25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period.
Requiring early-season quota-period overages to be deducted from the corresponding period during the following year.
Requiring ASMFC to revisit the Chesapeake Bay Cap and related management measures every three years.
And finally, requiring Virginia to create a 3-mile limit on reduction fishing like all the other states on the Atlantic Seaboard.

RE: Menhaden-Draft Addendum ii
I am writing to join the Chesapeake Bay Foundation in supporting the 50% reductions in CAP, 3 quota periods alternative to better assure protection of Menhaden populations during critical months for this essential species, as well as for the protection of Osprey reproduction in the Chesapeake Bay.
My wife, Jean, and I are fortunate to live along the headwaters of the Magothy River, a sub-estuary of the bay north of Annapolis, and during the last few years we have witnessed a dramatic reduction in Osprey, their fishing and their nests.
From my experience as a past president of the Magothy River Association, I can personally support CBF's conclusion that over-fishing of Menhaden is dramatically hindering Osprey reproduction.
Ladies and Gentlemen, as an attorney formerly retained by the U.S. House of Representatives for 24 years, I fully appreciate the political obstacles to your mission, and I commend you for your work.
Thanks you, Michael Christianson

Id like consideration of the following regards the harvesting of menhaden in the Bay:

1. Reduce the initial Chesapeake Bay Cap by 50%, from 51,000 to 25,500 metric tons.
2. Establish the Bay Cap at 13.6% of the coastwide total allowable catch so it can adjust when the coastwide quota changes.
3.Maintain 51,000 metric tons as the maximum Bay Cap, with no fixed lower limit.
4. Allocate 25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period.
5. Require early-season quota-period overages to be deducted from the corresponding period during the following year.
6. Require ASMFC to revisit the Chesapeake Bay Cap and related management measures every three years
7. Also I support Virginia being required to create a 3 mile limit on reduction fishing like all the other states on the Atlantic Seaboard.

On behalf of the true masters of the air, sea, and land, the glorious ospreys, please reduce the fishery cap by 50 percent. These remarkable creatures have previously suffered a staggering population decline from heavy use of DDT. They came back stronger than ever once DDT was banned, but starvation is not something from which the ospreys can recover. All the data show an alarming drop in successful osprey nests across the Eastern seaboard. And where there were successful nests, there were a reduced number of fledglings, with successful nests only producing one fledgling chick as other hatchlings starved. In Connecticut this past year, ospreys had the worst breeding success ever recorded. The primary cause of this massive osprey decline is the lack of food. Ospreys rely on menhaden as a prime and foundational food building block. Please act now to protect the ospreys by reducing the fishery cap to 50 percent.

Dear ASMFC Board Members,

I am writing as an avid bird watcher, specifically I enjoy watching osprey, eagles and other coastal birds. I urge you to prioritize forage fish conservation by approving strong measures under Draft Addendum II for Atlantic Menhaden.

Menhaden are vital to the health of our oceans, bays, and predator populations like striped bass. We cannot continue to allow industrial purse-seine operations to concentrate harvest in sensitive areas like the Chesapeake Bay.

I support:
* A substantial reduction in the Chesapeake Bay reduction cap under Draft Addendum II.
* Real reductions in the overall Coastwide Total Allowable Catch (TAC) that match the corrected science.
* Rejecting quota transfers that simply shift fishing pressure rather than keeping fish in the water.

We cannot continue to allow industrial purse-seine operations to concentrate harvest in sensitive areas like the Chesapeake

Bay, where concerns remain about localized depletion and impacts on predator species.

Please put long-term ecosystem health ahead of short-term industrial yield. Keep ospreys in our skies, flying free and well-fed.

Thank you.

Comment

Dear Atlantic Menhaden Management Board,

I am a Maryland resident who lives on the Chesapeake Bay, and I am submitting this comment because I am concerned about the long-term health of the Bay and its living resources.

I recognize that changes to menhaden management can affect the livelihoods of watermen and others who depend on the fishery, and I do not take that lightly. At the same time, I am concerned about the scale of commercial reduction harvesting in the Bay and whether we are taking too much of an important forage fish from the ecosystem.

I don't have the scientific expertise to say whether a 10%, 20%, 30%, or 50% reduction is the appropriate number, and for that reason I am not comfortable making a choice among those options. What I do believe is that when there is uncertainty about the abundance and distribution of menhaden in the Bay, we should err on the side of protecting the resource rather than assuming that current levels of harvest are sustainable.

I ask the Commission to carefully consider whether the scale and concentration of the reduction fishery in the Bay are

appropriate given the uncertainty about Bay-specific menhaden abundance and distribution. I also support continued investment in monitoring and research so that future management decisions can be based on better information.

The Bay is a shared resource, and protecting its ecological health and the communities whose livelihoods depend on it should be considered together. I hope the Commission will give appropriate weight to the long-term health of the Bay when making this decision.

Thank you for considering my comments.

Sincerely,
Elizabeth Beggins

As a member of and donor to the Connecticut Audubon Society, I strongly support their efforts to encourage osprey breeding. I am greatly distressed by their latest data which show a marked decline in successful nesting and survival of chicks. The stress of starvation is thought to be the major factor in this decline. Please control fishing so that menhaden can be available to feed these iconic birds. Thank you.

I am writing to express my strong support for significant, precautionary reductions to the Chesapeake Bay reduction fishery cap under Draft Addendum II that consists of the recommendations of the Chesapeake Bay Foundation.

Atlantic menhaden play a foundational role in the Chesapeake Bay ecosystem, serving as a primary food source for striped bass, osprey, marine mammals, and other sportfish and wildlife. Given the ecological importance of menhaden within the Bay's nursery grounds, industrial reduction fishing in these confined waters poses a distinct risk of localized depletion.

To protect the Bay's food web, I strongly urge the Commission to adopt the following measures in Draft Addendum II:

Maximum Cap Reduction: Select the option that achieves the highest possible reduction—up to 50%—from the current cap of 51,000 metric tons. Reducing the cap to the maximum extent permitted under this addendum provides essential interim protection against localized depletion.

Seasonal Quota Distributions: Implement seasonal management limits to prevent industrial harvest from being concentrated during key months when resident predators, particularly breeding osprey and migrating striped bass, rely most heavily on

menhaden as forage.

Precautionary Approach & Science-Based Limits: Continue moving toward full ecological reference points (ERPs) specific to the Chesapeake Bay, maintaining a precautionary stance or moratorium on industrial reduction fishing inside the Bay until localized depletion studies confirm that harvesting does not compromise ecosystem health.

The health of the Chesapeake Bay food web depends on maintaining robust menhaden populations in estuarine waters. I ask the Commission to prioritize ecosystem health and adopt the strongest conservation options presented in Draft Addendum II.

I have witnessed personally the impact of overfishing of menhaden on the Osprey population. I have participated in the Osprey Watch documenting sightings of ospreys at nesting stands, sightings of mating and nesting ospreys and seen firsthand the limited populations and infrequent nesting and mating and offspring around the Maryland central bay.

Thank you for the opportunity to comment.

Clear evidence for the decline of nesting ospreys can be found 60 miles south of the
Chesapeake Bay, at the Wright Memorial Bridge across Currituck Sound. There are approximately 25 power poles that parallel the north side of the bridge. Twenty years ago everyone had an Osprey nest. In the summer of 2026 there were 2.

Amid growing concern that Osprey populations along the Eastern seaboard are declining due to a lack of food, I support the Connecticut Audubon in urging the ASMFC to reduce the fishery cap by 50%, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Osprey, are not put in even greater jeopardy.

Even more so now, the numbers show that Osprey and other species that rely on menhaden do not have years longer to wait.

Menhaden are not eaten by people. Can we not save menhaden for wildlife that rely on them exclusively for survival?

Comment

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):

I am writing as a Maryland resident who was born and raised in Calvert County, has lived in in St. Mary's County since 2024, and has developed a lifelong, deep, personal connection to the Chesapeake Bay. I am an avid hiker, bird watcher, animal lover, conservationist, and outdoor enthusiast who spends as much time as possible on and around the Bay. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base.

I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.
The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - menhaden.

Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. Where and when the fish are removed matters.

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.

I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.

For that reason, I urge the Commission to establish strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months. Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coastwide fishery.

There is also an important management issue that deserves attention. The Commission's coastwide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.

I respectfully urge the Commission to:
1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.
2. Establish firm seasonal quota periods for menhaden.
3. **Prevent excessive concentration of reduction harvest during the summer months.
4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.
5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.

I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting.

The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake Bay users and stewards.

Sincerely,

Alyssa Lanpher
St. Mary’s County, Maryland

Amid growing concern that Osprey populations along the Eastern seaboard are declining due to a lack of food, Connecticut Audubon is urging the ASMFC to reduce the fishery cap by 50%, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Osprey, are not put in even greater jeopardy.
As the CT Audubon Society just released, mores than 60% of "successful" Osprey nests had only one hatchling this year, and the rate of successful fledglings is below 1 per breeding pair. Finding less hatchlings and starving fledglings is a clear sign that there is not enough prey, especially the decline in manhaden is extremely concerning!
I therefore urge you to set a clear cap for commercial manhaden fishery at 50%, and lower in the earlier season (before September), so Ospreys can still find enough prey during their breeding period!
Thank you for your consideration.
Adelheid Koepfer

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):
I strongly support reducing the Chesapeake Bay reduction-fishery cap by 50 percent—from 51,000 metric tons to 25,500 metric tons per year—and establishing strict seasonal quota periods for menhaden. The Chesapeake Bay is too important, and the ecological warning signs are too serious, to continue managing this critical forage fish as though the timing and location of harvest do not matter.
I have had a place on the lower Potomac River in St. Mary's County since 1999 and have been a full time resident for three and a half years and have developed a deep personal connection to the Chesapeake Bay and the Potomac River. My husband and I are avid boaters, anglers, and I spend considerable time on and around the Bay. I care deeply about the wildlife that depends upon it, particularly osprey, striped bass, and other species whose survival is tied to a healthy and abundant forage base.
We are seeing warning signs that should demand a precautionary response. Declining productivity, widespread osprey nest failures, and continuing concerns regarding the Chesapeake Bay and Potomac River striped bass population are not isolated issues. They are reasons to examine carefully whether we are removing too much forage from the Bay at the wrong time. Menhaden are a foundational forage species. They feed an extraordinary range of predators, including striped bass and osprey. Yet the reduction fishery can remove more than 100 million pounds of menhaden from Chesapeake Bay under the

existing annual cap. When a substantial portion of that harvest is concentrated into an intense summer fishing window, the issue is not simply how many fish are removed annually. It is when and where those fish are removed.
A menhaden harvested from a concentrated school in the Bay during the summer is no longer available to the predators that depend upon that school. Concentrated removal can create localized depletion during a biologically important period and can affect the availability of forage to other users of this shared public resource.
The consequences extend beyond the reduction fishery. Menhaden support the Bay's recreational fishing economy, commercial and charter fishermen, watermen, wildlife, and coastal tourism. One user group should not be permitted to concentrate an enormous harvest of a shared forage resource during the period when that resource is most important to the rest of the ecosystem and to other Bay users.
For that reason, I urge the Commission to take the following actions:
• Reduce the Chesapeake Bay reduction-fishery cap by 50 percent to 25,500 metric tons annually.
• Establish strict seasonal quota periods that distribute harvest throughout the year rather than permitting an intense summer harvest.
• Apply a precautionary management approach in light of uncertainty regarding localized menhaden abundance and the ecological condition of the Chesapeake Bay.
• Give greater consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the broader Chesapeake Bay economy.
The Chesapeake Bay is not simply a location on a fisheries-management map. It is a complex and interconnected ecosystem, and menhaden are one of its essential links.
We should not wait for further deterioration before taking action.
As someone who lives here, sails these waters, dives in them, and cares deeply about the wildlife that depends upon them, I believe the Commission has an obligation to manage menhaden conservatively and to recognize that the health of the Bay must take precedence over maximizing a concentrated industrial harvest.
Reduce the cap. Establish meaningful seasonal quotas. Protect the forage base. Give the Chesapeake Bay—and the people and wildlife that depend upon it—a greater margin for recovery.
Thank you for considering my comments.
Sincerely,
Renny Perdue

St. Mary’s County, Maryland

The menhaden quota should be reduced because the current level of harvest is placing real stress on the coastal food web, especially for species like Osprey that rely on menhaden as their primary prey during nesting season. When menhaden numbers drop, Osprey struggle to feed their young, leading to lower fledging success and weakened populations. The same ripple effects extend to other predators—bald eagles, herons, striped bass, marine mammals—whose health and stability depend on abundant forage fish. Protecting menhaden is not just about a single species; it is about safeguarding the ecological foundation that supports the entire Chesapeake Bay and Atlantic coastal ecosystem. Reducing quotas now is a necessary step to relieve that pressure and allow these interconnected species to recover.

“Menhaden Draft Addendum II”
I would like to enter my thoughts about the upcoming changes to Chesapeake Bay Menhaden Fish collection. I am deeply concerned about the decline of Osprey offspring this year in my home state CT. The numbers of fledged osprey have drastically reduced. Of the 679 total nest attempts, 40% failed. I live on the coast in Fairfield and see Osprey daily from March till September. They are a part of my daily life. It is very troublesome that their food source is being harvested for other means. I wish you to know that I support Audubon with their insistence for a 50 percent reduction in the Bay Cap, with option B2 for how the catch is distributed in amounts across time.

Submitted respectfully, Kathleen Shea

There was a significant error in the menhaden stock assessment.

Science confirms there are roughly 37% fewer menhaden than previously estimated.

The old TAC of 233,550 mt now carries a 100% chance of overfishing under the corrected science

The bait and reduction fisheries landed only 80% of the quota in 2024.

Hundreds of millions of extra pounds of menhaden were harvested in 2023–2025 because of the error

The science supports a substantial cut: a cumulative reduction closer to 50%.

The ocean TAC was cut 20% for 2026 only. The Bay Cap has not moved.

A narrow-sighted focus on just Chesapeake Bay threats expanding harvest further north and increasing total harvest.

The over harvesting of these fish are damaging an entire coast. Osprey are starving, the food web is collapsing. We must act now and implement decisive, meaningful change before it's too late. Please.

Sinerely,

Michelle Talich

As a Fairfield, Connecticut resident, I strongly support meaningful protections for Atlantic menhaden through Draft Addendum II to Amendment 3. I urge the Commission to adopt a 50% reduction in the Chesapeake Bay reduction fishery cap and seasonal harvest limits that help preserve this essential food source for ospreys and other wildlife.

Connecticut Audubon's preliminary 2026 Osprey Nation findings are deeply troubling. With 99% of the season's data compiled, productivity fell to 0.87 chicks per breeding pair, down from the previous record low of 1.26 in 2025. Forty percent of nesting attempts failed. These results raise serious concerns about the availability of food during the breeding season. Weather, disturbance, and other factors also affect nesting success, making continued research essential alongside immediate precautionary action.

Specifically, I support:

Section 3.1, Option B4: Reduce the Chesapeake Bay reduction fishery cap by 50%, from 51,000 to 25,500 metric tons.

Section 3.2.1, Option B2: Allocate 25%, 25%, and 50% of the cap across the three seasonal quota periods, shifting more

harvest to later in the season and easing pressure during spring and summer.

Menhaden management should explicitly account for the fish's role in sustaining the broader coastal ecosystem. Protecting abundant forage supports wildlife, sustainable fisheries, and the communities whose livelihoods and quality of life depend on healthy waters.

I also urge the Commission to pair these protections with effective enforcement, continued monitoring of prey availability and osprey breeding success, and timely review as new evidence emerges. Stronger safeguards should remain available if conditions warrant.

Our coastal wildlife is a shared public resource and a responsibility we hold for future generations. Please adopt these protections promptly and make the long-term health of the ecosystem central to this decision.

Ann Bilyew

I support the change to fishing. There has been less bait fish in our area which means less to eat for the ospreys. Sightings of birds have decreased. The nest in my back yard may have only had 1 fledged. It will be too quiet if there are no ospreys.

There is growing concern that Osprey populations along the Eastern seaboard are declining due to a lack of food. Last year, Connecticut Audubon's (the organization I am a part of) Osprey Nation recorded its lowest breeding success since the statewide community science program launched in 2014 to monitor the birds. This year is looking even worse. By Aug. 1, 2025, out of 706 nests with up-to-date reports, 113 had failed — about 1 in 6. In the same timeframe this year, of 691 nests with up-to-date reports, 171 have failed — roughly 1 in 4. The decline at Old Lyme's Great Island, once a former Osprey stronghold, has been particularly severe. Thirty-seven Osprey chicks fledged at Great Island in 2024. In 2025, that number decreased to 27. This year, only five chicks fledged. Because Ospreys feed almost exclusively on fish, the Osprey Nation community science program serves as an early-warning system for the health of Connecticut's waters and the abundance of prey species like Atlantic menhaden. We need to protect these birds by sustainably managing their food source and not prioritizing capital gain.

I strongly urge the Atlantic Menhaden Management Board to reduce the Chesapeake Bay reduction fishery cap by 50% and to adopt seasonal quota periods that prevent harvest from being concentrated during critical parts of the year.

As a Connecticut resident, I am particularly concerned by the recent decline in Osprey breeding success in our state. Connecticut Audubon's Osprey Nation program has reported a substantial increase in nest failures, and the decline at Great Island in Old Lyme has been especially alarming: 37 chicks fledged there in 2024, 27 in 2025, and only five in 2026.

Ospreys depend almost entirely on fish, and Atlantic menhaden are an important forage species for Ospreys and many other predators throughout the Atlantic coast. While no single factor should be assumed to explain recent Osprey declines, worsening breeding success is a strong reason to take food availability and forage-fish management seriously.

The Chesapeake Bay is an especially important nursery and feeding area, and the Commission has long recognized the value of managing the reduction fishery there precautionarily. Given the ecological importance of menhaden and the uncertainty surrounding localized prey availability, I believe the appropriate response is to leave more fish in the water rather than wait for definitive evidence of ecological harm.

A 50% reduction in the Bay cap is a reasonable precaution that would still allow commercial harvest while providing a greater buffer for Ospreys, striped bass, bluefish, marine mammals, and other wildlife that depend on menhaden. I also support dividing the cap into seasonal quota periods so that fishing pressure is not disproportionately concentrated during spring and summer, when predators may have especially high energetic demands.

Menhaden are worth more than the value of any single fishery. They support the broader Chesapeake Bay and Atlantic coastal ecosystem, including wildlife valued by people far beyond Virginia and Maryland.

Please adopt the 50% reduction in the Chesapeake Bay reduction fishery cap and strong seasonal protections under Draft Addendum II.

Menhaden are the most important fish in the sea. We must stop harvesting them in their juvenile stage, their first 18 months. We are killing the future three year olds that begin to reproduce. ALL MARINE LIFE depends on menhaden as their keystone food source, whales, dolphins, striped bass, cobia, eagles, ospreys. Menhaden are the primary water purification system removing more algae and phytoplankton then oysters; menhaden filter six gallons of water per minute. MENHADEN ARE THE MOST IMPORTANT FISH OF THE SEA we must stop killing the 18 month old juveniles of the Bay before they even have a chance to reproduce at age three years old.

As a Virginia resident, lifelong fisherman and someone who's entire career as an environmental engineer has gone into helping restore water quality in estuaries, especially the Chesapeake Bay - the path of unchecked or exploitative industrial practices on this recovering water body are unbelievably frustrating and must be changed. I support the 50% cut in total allowable catch and spreading the harvest/ quota seasons to different times of the year as suggested by the Chesapeake Bay Foundation. A community's right to certain jobs and a foreign company's right to profit do not supersede the right that the millions of people that live near and use the bay have to a healthy water body, especially as that water body is in recovery from centuries of pollution and human effects. Please consider adopting the full Addendum II measure. Sincerely, Brendan Luther

While I am strongly support future menhaden scientific study, I think Virginia along with other bay states has enough practical knowledge that the bay gets depleted and IMMEDIATE actions are needed to restore menhaden population and whole food chain. At least 50% harvesting reduction will be important step. Further reduction or raise can come as an outcome of the study. I believe Virginia fishery industry can avoid economic loses by switching to offshore fishing.

I support a 50% reduction in the Chesapeake Bay menhaden cap and the use of quota periods to spread harvest throughout the season. The Chesapeake Bay is being devastated by these commercial Omega menhaden boats. Please help save the CHESAPEAKE BAY before it's too late!

It's insane to let one company fish for pogies in this close. Lining pockets of out of country businesses and making excuses that the 300 employees need a job. I need a job, as well as all the other charter captains that have watched the decline of Bunker. Either a 50 percent reduction for 5 years to see how it responds or let em fish 3 miles or more off Va. Join the states that have some common since left. Say no to Omega

The commercial harvest of menhaden needs to be stopped. Several species of fin fish have declined in number and size because of troll netting. There exists many other sources of protein besides menhaden, which can be used my the manufacturer of these diet supplements. Because the chesapeake is important in breeding for many saltwater species, the menhaden need to be unpressured to allow balance in the bay's ecosystem

I fully support lowering the bay cap to 25mt as well as a quota for the harvest period. These changes protect the nursery that is the Chesapeake Bay. Further, it protects recreational opportunities to enjoy fishing within the bay. The mass culling of menhaden puts extreme pressure on fish and results in changing their migratory habits as well as their spawning.

As a fisherman in the Chesapeake Bay for over a decade. The amount of Menhaden has decreased and this year was the least prevalent I have seen the fish and this was reflected in the poor Cobia fishing season. As the migratory fish that spawns in the Chesapeake Bay, this lack of menhaden affects the ability to reproduce which not only impacts the bay, but the entire east coast. When talking to other fisherman in the bay, they have also seen much less menhaden this year. Especially with the two year hard freeze, abundant menhaden populations are essential to the rebound of the red fish population in the Chesapeake bay.

Commercial fishing for Menhaden should be suspended until the fish levels are greater then those of 2010. I have a home in Occohonnock creek and this year I saw no menhaden at all. No Rock fish and no Grey or Speckled trout and only caught Croaker 7" or smaller. I have watched the steady decline of both menhaden and Rock Fish to the point that this year there were none. Shame on the Commonwealth of Va for letting this happen.

I support new limits on commercial Harvest if menhaden. As a sports fisherman, I will be making decisions on where I vacation next year. I am thinking about a weeklong fishing trip to Exmore, VA to fish for red drum. I will be watching this decision closely. My decision on why to vacation there will largely be determined by this upcoming decision. If you do not adequately protect this community recreational resource, I will vacation elsewhere. I know I am just a drop in the bucket, but I remind you that sports fishing is a crucial element of the eastern shore tourism economy, and that I won't be the only sports fisherman watching this decision. I will refuse to support any form of VA tourism if you allow the impact of lower bay fishing to dramatically impact upper bay fishing that I can more routinely access..

I have watched my osprey nest in Richmond County, Va. with grave concern over the past 3 years. The adults have worked so hard to find the fish they and their chicks need to survive. Sadly, the chicks each year have one-by-one starved to death. What few menhaden I see the adults bring to the nest are TINY compared to years past. In my area this year out of 6 nests, only one baby survived....the reason, I supplemented her with fish caught off my dock. This over-fishing of menhaden has got to stop! Osprey and other species are being decimated by this practice!

Dear Commissioners:

I am writing as a recreational fisherman who has spent considerable time fishing the Chesapeake Bay and the coastal waters of Virginia. I strongly oppose the continued industrial harvest of menhaden in the Chesapeake Bay and off the coast of Virginia.

This is not simply an issue of one fishery competing with another. From my perspective as a recreational angler, the industrial reduction fishery for menhaden has become an issue of the overall health and productivity of the Chesapeake Bay ecosystem.

Over the years, I have personally witnessed significant changes in the abundance and distribution of numerous species within the Bay and its tributaries. Areas that once routinely held large concentrations of baitfish and game fish have, in my experience, become noticeably less productive. Species that depend upon abundant forage—striped bass, bluefish, weakfish, cobia, red drum, Spanish mackerel and others—are part of an interconnected ecosystem. Menhaden are not merely another commercially harvested species. They are a critical forage resource for a tremendous number of fish, birds and other predators.

When enormous quantities of menhaden are removed from the ecosystem for reduction into fish meal and fish oil, we should be asking whether we are taking too much of the foundation of the food web to support a relatively concentrated industrial fishery.

The Chesapeake Bay is a unique and enormously valuable natural resource. It should not be managed simply by asking how many menhaden can be removed while maintaining a population that technically meets a biological threshold. We should instead be asking what abundance of menhaden is necessary to support a healthy, resilient and productive ecosystem.

The economic consequences also deserve far greater consideration.

Recreational fishing represents a significant economic engine for Virginia and the Chesapeake Bay region. Recreational anglers spend money on boats, fuel, tackle, licenses, guides, marinas, boat repairs, lodging, restaurants and countless other goods and services. The economic activity generated by thousands of recreational fishermen is distributed throughout coastal communities and supports a broad network of small businesses and jobs.

Every fish that is caught recreationally represents far more than the value of that individual fish. It represents an entire economic chain—from the purchase of a fishing rod or boat, to the fuel used to reach the fishing grounds, to the meals purchased by anglers and their families.

By comparison, an industrial reduction fishery concentrates the economic benefit of harvesting enormous quantities of forage fish among a relatively small number of participants, while the ecological consequences of removing that forage base can be borne by the entire ecosystem and by the much larger recreational fishing community.

That is not a fair tradeoff.

I also believe management decisions need to recognize the value of abundance, rather than merely the value of maintaining a harvestable population. A healthy Chesapeake Bay should have enough menhaden to support its predators. We should be seeing abundant schools of baitfish, healthy populations of predatory fish and an ecosystem capable of supporting both commercial and recreational fisheries.

Instead, recreational fishermen are repeatedly being asked to accept restrictions, shortened seasons, reduced opportunities and declining fishing quality while an industrial fishery continues to remove tremendous quantities of the very forage that supports the ecosystem.

That approach deserves to be reconsidered.

I respectfully ask the Atlantic States Marine Fisheries Commission to take the following actions:

End or substantially restrict industrial reduction harvesting of menhaden within the Chesapeake Bay.
Establish substantially more conservative menhaden harvest limits in Virginia's coastal waters, recognizing menhaden's importance as forage for the broader ecosystem.
Give substantially greater weight to the economic value of recreational fishing when evaluating menhaden management decisions.
Adopt an ecosystem-based management approach that considers the forage requirements of striped bass, bluefish, weakfish, cobia, red drum, Spanish mackerel, birds and other predators—not simply the population of menhaden itself.
Increase transparency regarding the actual distribution and magnitude of menhaden harvests within the Chesapeake Bay and Virginia coastal waters, including the ecological and economic assumptions used to establish allowable harvest levels.
Put the health of the Chesapeake Bay ecosystem ahead of maximizing the allowable harvest for industrial reduction purposes.

The Chesapeake Bay belongs to all of us. It belongs to the recreational fishermen who spend countless days on its waters, to the families who enjoy its resources, to the businesses that depend upon recreational fishing, and to future generations who deserve to experience a productive and healthy Bay.

As a recreational fisherman, I have personally watched the changes taking place in the Bay. I do not believe we should wait until the effects are impossible to reverse before taking action.

Menhaden are too important to the Chesapeake Bay to be treated simply as an industrial commodity.

I urge the Commission to reconsider the continued allowance of large-scale industrial reduction harvesting of menhaden in the Chesapeake Bay and Virginia's coastal waters and to adopt management measures that prioritize a healthy, abundant forage base and a thriving recreational fishery.

Thank you for considering the perspective of recreational fishermen who depend upon and care deeply about the Chesapeake Bay.

I'm an avid bay and river recreational fisherman. I've seen the decline in some of our best species of fish. Mostly striper which I used to always be able to catch several decent fish. The regulations for recreational fisherman and the lack of fish, keep me from even trying to brave those cold December mornings. Sad isn't it. Maybe letting one of their prime meals get a chance to repopulate might help. I'm no scientist, but I believe this is a smart decision to let the bait fish naturally restore themselves.

As an avid long Island south shore fisherman there has been a very noticeable decrease in the bunker schools. I definitely feel a reduction in catch rates should be put in place as soon as possible. I dont feel that its is right for the needs of a single company to able to strip a natural resource which affects so many local resources that are dependent on the bunker as a source of food. Please give this the serious consideration it deserves. Bryan Rose

I fully support reducing the current menhaden quota by the proposed 50%. This is a good start but Cooke Inc aka Omega Protein should be pushed out of the Chesapeake Bay completely atleast 3 NM off the coast similar to every other state on the east coast. They also should not be able to impede menhaden from entering the Chesapeake Bay. It also should be illegal to use spotter planes, drones, etc for the purpose of spotting menhaden. I hope you make the right decision to save this great natural resource before it's too late and has a lasting negative effect on the Chesapeake Bay ecosystem.

I have been fishing the Chesapeake Bay for 30 years. In the early 2000's there were so many menhaden in the bay that you would frequently be surrounded by giant schools of breaking fish acres in size so thick you would had to yell over them to talk to people in your boat! There were mature fish from 8" to almost a foot long everywhere you looked. The large striped bass were almost always with them well into the summer and it was easy to catch your limit of those trolling just a couple rods. (where now some people use planner boards and 20 or more rods to catch just a couple fish over an entire weekend of trying.)

The menhaden population has been decimated by the reduction fleet and they have fought tooth and nail to keep anyone from studying it, and whenever there is a meeting they flood the building with supporters to keep out any other public from participating. Their lobbyist work over the politicians and they have friendly seats on the boards that control everything about what they consider "their fishery"! And that doesn't even count what their nets do to cobia, redfish and other predators. They say they don't catch any until a net breaks tens of thousands of dead gamefish wash up on the eastern shore! (Rember that? Look it up if you don't)

They will not be happy until the last bunker is gone from the bay and then they'll blame "Climate change" and just fish offshore anyway. They need to be made to stop fishing the bay until it is determined by INDEPENDENT SCIENCE that it is sustainable! Make them fish in the ocean where the coastwise stock assessment shows the stock is healthy until we know for a fact one way or the other.

That is the ONLY thing that makes sense! There are 10,000 jobs that depend on the bay for every 1 of the reduction fleet jobs. Who is more important to the economy of our state and at what costs to the health of such an important resource. Please do the right thing and stop reduction fishing in the bay which should have been done 10 years ago.

Shut Omega down. Keep the blue cat invasion from eating all the sport fish, rock, white perch… etc. kick Omega off shore. No other state allows them to rape their waters like Virginia does. The bay is doomed without decisive and drastic measures. Do what you're paid to do. Protect the bay.

It's not about whether menhaden are "overfished" by safe population numbers. It is about whether excess fishing of menhaden is leaving the bay and tributaries overburdened with plankton, allowing the expansion of excessive algae blooms and the resulting deoxygenated dead zones.

Menhaden are filter feeders. Using gill rakers to collect algae and other forms of plankton as they swim, menhaden filter 7 gallons of water per minute. In food-rich environments, they feed by ramming, swimming with their mouths wide open driving water over the gill rakers collecting food. Menhaden can live up to 12 years filtering over 10,000 gallons on a good day. Preserve the menhaden to preserve the marine environment.

Please follow science and observation, which strongly suggests that the menhaden biomass has been severely and negatively affected by the large-scale commercial fishing industry operating in Virginia's Chesapeake Bay and Atlantic waters. The ramifications of this industry's actions has far-reaching consequences biologically and geographically, across multiple species and waters. Please make the environmentally/ethically appropriate decision and reduce the commercial catch quota allotted to the menhaden fishery, of which the most signifcant and largest operation is primarily based in Reedville, Virginia. Thank you.

There are NO menhaden adult menhaden in New Jersey this summer. Ospreys are now targeting fluke at low tide as they have no food! Menhaden are the most importent fish in the ocean. This once very plentiful fish is disappearing and the reason is overfishing by Canadian owner Omega Protein! Please take action before it is too late. We don't need a reduction, we need a three year moratorium!

The ecosystem has been violently stirred, give the bay what it neeeds to protect future generations and support a healthier ecosystem. The bay isn't some cash crop… it's the east coast's sanctuary responsible for reproducing a lot of the inshore, offshore, and migratory species we see today on the decline. Easy for anyone to see that this is a problem, yet big corporations and local government quickly turn a blind eye when blinded by big money…

After you've admitted to mismanaging the fishery for years it's time to protect it and give it time to heal from your neglect and error, why has every other state on the eastern seaboard already acknowledged the damage of purse seine nets and industrial fleets fishing inside state waters why won't Virginia do the same? The answer shouldn't be "because they've been doing it for years" or have anything to do with lobbyists money it's time for you to act to protect the bay and its ecosystem make the right decision for once and make it loud cut the full 50% show the people who you actually are here to serve

I strongly support reducing the commercial menhaden harvest cap by 50%. Menhaden are a critical forage fish and an essential food source for Ospreys and many other marine and coastal species. Healthy menhaden populations are vital to a healthy ecosystem. I urge the Atlantic States Marine Fisheries Commission to take a precautionary approach and adopt the 50% reduction option to help ensure there are enough menhaden to support the wildlife that depends on them

I strongly urge the Commission to adopt the maximum 50% reduction in the Chesapeake Bay menhaden reduction fishery cap. Menhaden are a foundational forage species that support striped bass, osprey, dolphins, and the broader ecosystem of the Bay and entire Atlantic coast. Removing them at the present industrial scale puts needless pressure on an already stressed environment. Please prioritize the health and future of the Chesapeake Bay and its wildlife over maximizing short-term destructive harvests, and adopt the strongest reduction allowed!

I support reducing the Chesapeake Bay fishery cap by up to 50% and creating quota periods to distribute harvest under the cap more evenly throughout the fishing season. This action would stop the reduction in osprey survival that has recently been seen and will benefit other wildlife.

I grew up in Virginia, and I've always fished the rivers and ocean there. But I'm 43 years old and I have noticed a dramatic drop in the quality of fish to catch, fewer drums, skinny striped bass, spending all day to catch one fish over the limit to keep, when I remember filling a cooler in an hour as a kid, meanwhile I've steadily seen more and more omega boats hat eating menhaden.these companies are using boats, planes and modern electronics to decimate the food foundation of the Chesapeake bays food chain, IDC how much money omega pays you, when the fish all die or migrate omega and their money will leave with the fish, but u guys are gonna be stuck here dealing with a pissed off public. It's your job to maintain and manage the wildlife, not to subcontract that responsibility to a private party. Do your job and stop omega from destroying our fisheries! My 9yr old son absolutely loves fishing and I really wanna see my grandkids be able to catch something they can eat in 20 years...

I would like to support a 50% reduction in the bay cap and link the future bay cap to the overall coast-wide quota. As a life long bay fisherman and resident of Virginia Beach of 40+ years. I have witnessed the long term effects of the overfishing of menhaden. The large schools of menhaden that were effective at filtering the bay water and supporting popular gamefish and birds of prey have been vastly depleted. Everyone focuses on the oyster regarding filtering the water in the bay, however the menhaden has just as an import role in filtering the water. In my opinion, since they are not bound to one place they can filter more surface area efficiently. I'm tired of Omega Proteins greedily profiting off this public resource, which has wrecked the ecosystem of the Chesapeake Bay. There needs to be a better balance of harvest of available stocks in the bay with a goal of increasing those stocks. The Chesapeake Bay should not take the biggest hit because it is the most profitable source. Balance should be maintained both locally as well as regionally. Therefore, I reiterate my support for the 50% reduction in the bay cap and link the future bay cap to the overall coast-wide quota. Respectfully, Will Filomarino

As a human, I am speaking to you on behalf of these birds and their dependence on the fish, specifically menhadin, to feed and nourish their offspring. We as humans have caused this crisis. We as humans can reverse this harm. There are so few harms that we humans have done to our home that can be addressed and corrected with simple solutions. This one where there IS a simple solution. Let us employ our intelligence for the survival of the osprey.

You must stop this strip-mining of our resources and the destruction of an ecosystem. There is much more involved than a simple baitfish. This is the basis of the ecosystem that is the entire East Coast of America. There needs to be a moratorium on commercial harvesting to save th system.

There is growing concern that Osprey populations along the Eastern seaboard are declining due to a lack of food. Last year, Connecticut Audubon's Osprey Nation recorded its lowest breeding success since the statewide community science program launched in 2014 to monitor the birds. This year is looking even worse. By Aug. 1, 2025, out of 706 nests with up-to-date reports, 113 had failed — about 1 in 6. In the same timeframe this year, of 691 nests with up-to-date reports, 171 have failed — roughly 1 in 4. The decline at Old Lyme's Great Island, once a former Osprey stronghold, has been particularly severe. Thirty-seven Osprey chicks fledged at Great Island in 2024. In 2025, that number decreased to 27. This year, only five chicks fledged. Because Ospreys feed almost exclusively on fish, the Osprey Nation community science program serves as an early-warning system for the health of Connecticut's waters and the abundance of prey species like Atlantic menhaden.

The menhaden policy should ensure adequate supply in the Chesapeake Bay for the next generations of people. This means erring on the side of caution. I favor stopping large scale menhaden harvesting in the bay altogether for several years. Then evaluate the effects on economy and ecology.

The Atlantic Menhaden is a critical food species for almost all the large predators, food fish, and game fish of the U.S. Atlantic Coast. Osprey, the iconic wild birds of the Atlantic Coast, are starving from Cape Cod down to Cape Hatteras, to serve the fecklessness and green of a few investors. It's also near-criminal that billions of dollars in commercial revenue from recreational fishing, birding, whale-watching, etc. are being threatened to save a few dozen Virginia jobs in a marginal industry at a company that's not even locally owned.

My wife and I live in CT and have been kayaking in Long Island sound for 35 years. We have several launch points ranging from the Norwalk Islands to Barn Island near Stonington CT and have observed menhaden schools in the summer just about every year in varying numbers. We typically kayak once or twice a week in summer and early fall. Starting three years ago we have not seen any menhaden schools in their usual haunts (Sachem Head, Thimble Islands, East River, Granite Bay, etc). We always see numerous Ospreys in spring and summer and know of many reliable nesting sites along the CT coast and often watch them fishing. In our non scientific observations the Ospreys seem to have fewer successful strikes than in the past. We are well aware of the reduction in successful Osprey fledging in Chesapeake Bay and along the CT shoreline and of the fishing pressure on menhaden in the Chesapeake. To lose a viable Atlantic Menhaden population would be disastrous for the wildlife that depends on this keystone food source and also for sport fisherman all along the East Coast. We support a very significant reduction in the menhaden fishing cap to allow for their recovery and sustainability into the future. Peter and Diane Gucciardo 14 Washbrook Road Newtown CT 06470

WANT TO HELP? COPY & PASTE THIS COMMENT:

I strongly support reducing the commercial menhaden harvest cap by 50%. Menhaden are a critical forage fish and an essential food source for Ospreys and many other marine and coastal species. Healthy menhaden populations are vital to a healthy ecosystem.

I urge the Atlantic States Marine Fisheries Commission to take a precautionary approach and adopt the 50% reduction option to help ensure there are enough menhaden to support the wildlife that depends on them.

Please reduce the quota for commercial menhaden harvesting as much as humanly possible, and implement recreational guidelines for net fishing juvenile menhaden in the bays and estuaries. At the most extreme, a moratorium on all commercial harvesting would be preferred. The pressure put on these fish by recreational fisherman at the juvenile stage, plus the ongoing commercial harvest of menhaden from the Delaware Bay through the North East Corridor has created a clear decrease in stock across the board. As an avid recreational fisherman and beachgoer, I expect to see hundreds of pods of bunker every summer. I have not seen one single school this season, and I have covered over 80 miles of water in single inshore trips up to 35 miles from shore.

The industrial stripping of menhaden (bunker/pogies) and the resulting mortality of the bycatch swimming with them has become entirely inexcusable. Industrial reduction boats are effectively vacuuming foundational nutrients out of our ocean ecosystem. This deprives marine mammals—such as whales, seals, and dolphins—and predatory birds like osprey of their primary food source, while severely disrupting critical game fish populations including weakfish, striped bass, and tuna.I have witnessed these operations firsthand, watching spotter planes and reduction ships vacuum entire schools of fish out of the water. The immediate ecological fallout is devastating: birds are left starving, marine mammals are forced to migrate or suffer, and game fish vanish from our coastal waters. Consequently, our local recreational angling, commercial fishing, and eco-tourism/whale-watching industries are bearing the economic brunt of this practice.Corporate operations like Omega Protein are depleting the sea of the core biological nutrients required to sustain a healthy ecosystem. As a recreational fisherman who actively targets fish up and down the New Jersey coast, I see this environmental damage firsthand.

To whom it may concern.. I have been a property owner in Cecil County on the bay in Elkton for 15 years. I have been fishing the upper bay for Striped Bass ever since. I've given up. I haven't seen a menhaden school up here in years. It's no longer worth the gas to catch just catfish. I urge the commission to take immediate and significant action to curb the commercial harvesting of our most important baitfish in the bay. Additionally, this year, I saw zero Osprey chicks in the multiple nesting sites that I frequently pass north of Turkey point.. Please DO SOMETHING!

My family and I live bayfront and have watched osprey nests in the water behind our for years. Last year our nesting pair failed to fledge any young and this year has been a terrible struggle for them. They have brought no bunker back to the nest. We only see them with small fluke. And we have a fortunate nest site. The majority of nests in our area lost their fledglings because food was so scarce. Parents abandoned their young because they could not find bunker to feed the babies. You need to stop allowing Omega to decimate the bunker in Chesapeake Bay as well as along the coast. It is so short sighted to allow this over fishing. The entire ocean as well as the osprey and other species depend on the menhaden. Let Omega figure out some other way to get what they need - please protect this precious resource. The osprey will take years to come back from this. Please give them and the other affected species that chance. Paula Brennan Long Beach Township NJ

We on the east coast have had much to celebrate over several years now, with the ongoing robust Osprey population and lots of people put lots of effort into into helping them rebound.. this return following an almost near extinction of the species due to impacts from DDT. Now it seems we are on the brink of another collapse due to the very high mortality rate among chicks both last year and this. The chicks are apparently starving and we must cease the apparent over fishing of their main food..menhaden. I ask you to please vote to reduce the Chesapeake Bay reduction fishery cap by up to 50% to allow the Osprey a chance to rebound with healthy fledglings. They need our help again and this is where we must start. Thank you for your consideration. Joan Meek Old Lyme, CT

To whom it may concern, I would like to strongly urge the commission to reduce the fishery cap by 50% to help ensure enough menhaden remain available for Ospreys and other wildlife. The CT Audobon Society has worked tirelessly to ring the Osprey back from the brink of extinction in our state. Please consider the impact on this species if their only food source is allowed to be fished even more than it already has. Don't reverse all the hard work countless people have put in to insure the Osprey remains a vital part of our ecosystem. Thank you for your time.

Please put a moratorium on menhaden and shut down the harvest in its entirety. Let it recover for a 5 year period. If that's not feasible put a commercial ban on harvesting menhaden within a 5-10 miles ban anywhere along the east coast. No commercial harvesting in the Chesapeake Bay and Delaware Bays. Push the commercial trawlers well off shore away from the coastline, before they wipe out the bunker.

As a resident of St. Mary's county who is constantly in Breton Bay, Potomac River, and Chesapeake Bay, I have been alarmed by the extreme drop of in marine activity this year. I have not seen the schools of menhaden, strippers, blues, sea trout, and perch that are normally active in the area. I typically kayak fish and have caught zero stripped bass in the last 18 months and the fish I do catch are way smaller and the numbers are 1/10 of prior years. I normally would invite people from out of the area to come to enjoy Leonardtown/St. Mary's County so they can experience the beauty and amazing fishing but the last 12 months have been so alarming that I worry we have reached a point of no return. Please do what you can to reduce/cut the menhaden cap by 50% to give this area a chance to recover. I have loved fishing my whole life but this year in particular has me praying that we can turn this around and see a recovery as this is pivotal to the economy, quality of life, and ecosystem.

Comment

Dear Mr. Boyle and Members of the Atlantic Menhaden Management Board,
I am writing to submit public comment on Draft Addendum II to Amendment 3 of the Interstate Fishery Management Plan for Atlantic Menhaden.
As someone deeply invested in the health and future of the Chesapeake Bay ecosystem, my primary goal is to see industrial reduction purse-seining completely removed from the Chesapeake Bay.
The Chesapeake Bay is an ecologically sensitive, enclosed nursery ground. Allowing industrial factory vessels to extract tens of thousands of metric tons of menhaden—the foundational forage base of the entire estuary—directly undermines the recovery of recreationally and commercially vital species like striped bass, causes documented starvation and nest failures among Bay ospreys, and harms local bait and crab fisheries.
Under the specific alternatives presented in Draft Addendum II, I urge the Board to adopt the most protective conservation measures possible:
Adopt the Maximum Cap Reduction (50% Cut):
I urge the Board to adopt the full 50% reduction to the Chesapeake Bay harvest cap immediately. While an outright ban on reduction fishing within the Bay is the only true long-term solution, cutting the cap from 51,000 metric tons to 25,500 metric tons (or lower) is an essential, overdue precautionary step to curb localized depletion.
Implement Strict Seasonal Quota Periods:
I support dividing the harvest cap across three seasonal quota periods. Allowing large industrial fleets to concentrate their harvest during spring and summer months creates intense localized forage deficits right when breeding ospreys, migratory predators, and juvenile fish need them most.
Chart a Path to End Industrial Reduction Fishing in the Bay:
The ASMFC must acknowledge that every other Atlantic coastal state has already banned or restricted industrial reduction purse-seining in internal waters. Omega Protein's industrial reduction operations can operate in the open Atlantic Ocean; they do not need to operate inside the nursery waters of the Chesapeake Bay. The Board should initiate management actions aimed at moving the reduction fishery completely out of the Bay.
A healthy Chesapeake Bay economy and food web must take priority over the private profits of a single industrial reduction corporation. Please adopt the maximum 50% cap reduction under Draft Addendum II and commit to a full phase-out of industrial reduction harvest inside the Bay.
Sincerely,

Matthew Shoultz

I have been following this and many other fisheries for over 25 years now. I spend many more days on the water than I should. I recognize that my observations are only anecdotal information but that doesn't make it wrong. Maybe it was the many upwellings we had this year, maybe it's just the normal ebb and flow of populations but we seem to be experiencing a severe shortage of bunker this year. When Lund's Fisheries has no bunker for sale for local crabbers, when my marina has no peanuts under the lights at night, when we have a dearth of osprey on the nests and a far smaller population of "resident" stripers in our river and bay then any open-minded person would suspect that there is an issue. Government agencies like ASMFC seem to love to apply the precautionary principle to regulating fluke and sea bass populations for recreational fishermen. Seems to me like you should be consistent and apply it now in managing menhaden. You must also be cognizant to the potential for depletion of the species in localized areas. Too many fish taken too soon from one area can have negative consequences for the health of prey species even if the annual harvest target is met.

Every osprey nest i track, five in all, produced yzero chicks that fledged successfully. This is all due to lack of food. Osprey in our area live on bunker, when they were forced to live on juvenile fluke they were unsuccessful in rearing offspring. This is all do to over harvesting bunker. I urge you to drastically reduce the quota, we are in a tragedy situation. Robert Raimo

For the last 5 years, I have been monitoring an Osprey nest from a bird blind on the Quinnipiac river here in New Haven, CT. During the first three years the Osprey's nest was successful with three fledgelings on the 3rd year. Last year the Ospreys did come back, mated and then abandoned the nest before even laying eggs. This year they mated, laid eggs and I was able to see two little heads popping up. I observed that both parents then abandoned the nest and were unable to succesfully raise the newborn birds. Ospreys need our help if we want to continue seeing these amazing birds. They are suffering from the lack of food which used to be more plentiful. Could we please share our planet with our animal friends?

Public Comment on Atlantic Menhaden Chesapeake Bay Reduction Fishery Cap

I am a Virginia recreational angler and a board member of the Peninsula Salt Water Sport Fishermen's Association. I am submitting this comment in my personal capacity and am expressing my own views, not speaking on behalf of the Association.

I strongly support a 50% reduction in the Chesapeake Bay reduction fishery cap, along with measures to better distribute the remaining harvest throughout the fishing season.

There is a simple way to think about this issue: the Chesapeake Bay is a nursery, and a nursery needs food.

The Bay is an incredibly important nursery and feeding area for young fish and other wildlife. Menhaden are a critical part of that ecosystem, providing forage for striped bass, bluefish, weakfish, red drum, cobia and many other fish, as well as birds and other predators.

I understand that Atlantic menhaden are considered healthy on a coastwide basis. But a healthy coastwide stock does not necessarily mean that sufficient menhaden are available in the Chesapeake Bay, at the right times and in the right places, to support the predators that depend on them.

That distinction matters.

ASMFC has recognized the concern over localized depletion in the Chesapeake for years. The Bay reduction-fishery cap was established in part because of concerns about removing large quantities of menhaden from this important nursery area. Today, we are again being asked to consider whether the amount and concentration of reduction harvest in the Bay could have ecological consequences.

I don't believe we need to prove that menhaden harvest is responsible for every problem facing Chesapeake Bay fisheries before taking reasonable precautionary action.

When there is uncertainty about how much forage a critical nursery ecosystem needs, the responsible approach is to leave more

forage in the system—not remove the maximum amount we are allowed to take.

A 50% reduction would still allow a commercial reduction fishery to operate while leaving substantially more menhaden available to the Chesapeake ecosystem. Distributing harvest throughout the season would provide additional protection against concentrated removals during periods when menhaden and the predators that depend upon them may be particularly important.

Our fishing club has been using a simple phrase in our public outreach:

“The Chesapeake Has Hungry Babies.”

It is intentionally simple, but I believe it captures the heart of the issue. A nursery cannot fulfill its role if we don't ensure that there is enough food in it.

As recreational fishermen, we have a tremendous stake in the health of the Chesapeake and the fisheries it supports. We are not asking that the commercial menhaden fishery disappear. We are asking for a reasonable reduction in harvest from a uniquely important nursery ecosystem and for a management approach that puts the health of that ecosystem first.

We may never have perfect science capable of telling us exactly how many menhaden the Chesapeake needs. But that uncertainty should be a reason for caution, not a reason to continue removing the maximum amount allowed.

I respectfully ask the Atlantic Menhaden Management Board to adopt the full 50% reduction in the Chesapeake Bay Reduction Fishery Cap and implement measures to distribute the remaining harvest throughout the fishing season.

The Chesapeake is a nursery. Please leave the babies something to eat.

Paul Downey
Board Member, Peninsula Salt Water Sport Fishermen’s Association
Virginia Recreational Angler

I have been a recreational fisherman on the Chesapeake Bay for 25 years and have seen the damage done by Omega first hand. I have watched the population of striped bass and many other gamefish rapidly decline from abundant to practically non-existent. This decline is directly attributable to Omega Protein. Omega is literally killing the Bay to make dog food and fish oil. You cannot fully understand the extent of this decimation unless you have seen it directly. I am fully in favor of imposing the maximum catch restrictions. If something is not done now it will be too late. Please save the Bay for the current and future residents of all mid-Atlantic states.

I am a waterfront property owner in Anne Arundel county MD and an avid recreational fisherman. I have been following the decline of the rockfish population and was shocked recently to learn of the Omega reduction fishing operation in Virginia that has been taking millions of menhaden from Chesapeake Bay waters using huge ships and spotter aircraft. Menhaden are a vital part of the region's food chain for many species of fish and birds and the massive killings of this forage fish must stop. Move that operation out of our Bay and slash the authorized harvest of Menhaden by greater than 50%. Do it now and save our bay species!

the reduction of menhaden harvest is heading in the right direction, however it should be zero. having watched the harvesting off of Assateague with the squadron of vessels culling menhaden was astounding, same I am sure goes for the Chesapeake. since the harvesting began, there was a huge outcry from commercial and recreational fisheries, due in most part to the decreasing potential of forage menhaden provided to all fisheries. there has been a dramatic drop in the recreational catch which has been going down for the 45 years I have been fishing the region. end the mass depletion of menhaden and give the fishery a chance to get back to where it was 50 years ago. thank you

The Atlantic Menhaden is a beneficial fish for both humans and animals to include the Osprey. High in Omega 3's and even used as fertilizer and supplements for human and animal consumption. This is a gift from our planet. We must learn to divide our gifts from this earth between humans and other animals. The earth has a limit for everything. We as human beings, being as intelligent as we are, must find a way to preserve this resource so we can save other species in the process. the lose of one species affects others, lets be smart, and limit the amount of Menhaden in fertilizer and supplements to save some for other marine life. They need to eat and get their nutrition from this fish. Lets share and preserve a natural resource so it does not decline any further.

Public Comment in Support of Closing the Chesapeake Bay Menhaden Reduction Fishery

Dear Members of the Atlantic States Marine Fisheries Commission,
I strongly support a complete closure of the menhaden reduction fishery in the Chesapeake Bay.
Over the past ten years, I have personally observed a dramatic decline in menhaden along the Delaware coast. Areas where menhaden once seemed abundant now appear to have very few. I recognize that the reduction fishery may not be the only factor responsible for this decline, but the apparent depletion is concerning enough that continuing to remove large quantities of this important forage fish is an unnecessary risk.
Until an appropriate study can determine the causes of the decline and establish that the population can support the reduction fishery without harming the broader ecosystem, I believe the precautionary approach is to close the reduction fishery in the Chesapeake Bay.
Menhaden are a critical food source for many species and an important part of the coastal ecosystem. We should not wait until their decline becomes irreversible before taking action.
Please support a complete closure of the Chesapeake Bay reduction fishery until sufficient science demonstrates that continued reduction fishing is sustainable.
Thank you for considering my comments.

In the 1980 edition of the Roger Tory Peterson bird book, Osprey were incidental to the northeast. Since then, Osprey have made a miraculous comeback with nests all along the CT shoreline. They are majestic birds that need to be protected. Allowing commercial fishing of most of the fish Osprey feed upon in the mid-Atlantic is a crime against nature for purely profit motives. We used to see many schools of bunker aka Atlantic menhaden in the waters of Long Island Sound east of New Haven, CT. Now, we don't see any. Please limit the commercial fishing that is taking food from Osprey young.

I support the Atlantic Menhaden Addendum II and a significant reduction in Menhaden fishing in the Chesapeake Bay (I would support upto a 50% reduction in Menhaden commercial fishing or if too drastic, a growth path to a 50% reduction over five years. This critical food supply for many species in the Bay is important to the ecosystem of the Bay and should not be commercially overfished. Thank you.

I completely support a 50% cap reduction on the menhaden harvest. The bay and particularly the mouth of the Rappahannock has become the Dead Sea. I grew up in the 70s and lived on fish I caught. Please help.

I strongly support the 50% reduction in the amount of Menhaden harvested. I can see impact that the declining population of menhaden is having on both the osprey population as well as the bluefish and striped bass population. There used to be large amounts of menhaden here in Essex CT in the summer months and this year there are hardley any.

Highly endorse SIGNIFICANT reduction in the Bay Quota. Have seen a significant reduction in Menhaden reaching the middle Bay, and it's impact on Osprey. Also endorse spreading the quota out over time to allow migration.

I'd like to see a larger cap. Since being on the Chesapeake and Ocean side of the Delmarva penninsula, I have seen, from my perspective, a large drop in the amount of fish (flounder, stripers, etc), an increase in foraging dolphin, a decrease in water fowl and birds of prey. All of which are directly or indirectly impacted by over fishing. I have no hard proof, this is only observation from living on and boating on the bay and ocean. I hope it is well received. Thank you, George Davidsen

Dear members of the Atlantic Marine Fisheries Commission There has been such an incredibly powerful increase in support of wildlife over the years as people witness species make a comeback thanks to the efforts of humans. The great resurgence of ospreys in Connecticut and especially around Great Island in Old Lyme, CT has been especially rewarding for so many. Over the years we have supported placement of nesting platforms for the osprey nests and experienced the joy of seeing babies occupying the nests. It proved that people can help support wildlife and bring back endangered species. We are greatly disturbed by the significant reduction in successful fledging of osprey in the state. We encourage the reduction by 50% of the Chesapeake Bay menhaden fishery cap. This will greatly ensure enough menhaden remain for osprey and other wildlife. Thank you for your time. Sincerely, Mary Ellen Kunz

We have been fishing the bay for years, and have steadily noticed a decline in the number of manhaden schools as well as the volume of each school that we have seen. It is also become more difficult to catch fish like stripers in the bay, other observations are that offspring seem to be smaller than they have been in years past. We would love to see Virginia join every other East Coast state, and keep Omega out of our waters.

I just attended a meeting at Meigs Point Nature Center here in Madison CT. on this very subject, the reduction of these protien-rich fish for the young osprey. We have been so encouraged in a few years past at witnessing the growth of population with osprey on our coastlines, eagerly awaiting their return for nesting and fishing in Long Island Sound. Please do not allow their population to backslide due to this important food source for their young! we cherish our osprey population here, and the loss, especially after the last comeback, would be devastating to all!

We cannot continue to invade earths resources and all of its inhabitants in such unecssary ways. The ospreys (et al) have finally made it back to population after devastating spray chemicals years ago, how many times could they contnue to overcome human harm. Reducing the cap by 50% helps all wildlife (inlcuding humans). This is a serious and necessary step in protecting all concenrs for generations to come.

I support any reduction to the harvest of menhaden. As a recreational fisherman I feel it is neccessary to ensure the sustainability of sportfish that rely on menhaden as food. The Omega corporation's practices have harmed the Chesapeake bay and I would like to see as large a reduction in harvest as possible.

Dear Members of The Atlantic States Marine Fisheries Commission:

I am an environmentalist and wildlife photographer. Over the years I have had the pleasure of watching Osprey return each spring to their life-long mate, and raise and fledge their young. I've also had the pleasure of watching as their population rebound after protections were put in place to limit the use of pesticides that cause their eggs to break. You can then imagine my heartbreak watching hatchlings die of starvation in their nest this year when their parents had no food to bring to them.

Osprey thrive when the menhaden runs are plentiful. They have enough food to keep themselves healthy and to feed their growing young. In good years, two or three babies can fledge from a single nest. Unfortunately, this year was incredibly difficult for these birds. Only 1 in 4 nests had young survive to fledge, and these "successful" nests had fewer young flege. As someone who loves nature, it was incredibly painful to watch hatchlings die of starvation - such a preventable cause.

I am begging you to reduce the Chesapeake Bay menhaden fishery cap by 50%. Please consider the impact of the decision you make. This cap will allow humans and wildlife to thrive together, both will have enough food to meet their needs. We are in a pivotal time in history. We, as humans, are under obligation to make conscientious choices to protect vulnerable species. We have the ability to make changes that allow humans and our environment to thrive together. While animals are under constant assault from chemicals, global climate change and habitat loss, this is a small thing in comparison that will make a huge difference. Please, reduce the menhaden fishery cap by 50%.

Sincerely,
Barbara Scavotto

Pass this amendment. This is way overdue!! Our nations largest estuary needs all the help she can get right now. Don’t stop at the Chesapeake, lower the TAC for the Atlantic East coast as well. I fish out of Chincoteague and can see the devastating effects these bunker boat fleets have on prey species along ESVA.

I have summer place directly on the Farm River in East Haven, CT.. We purchased this place in 2021. I absolutely remember the summer of 2021 through 2023 there would be literally hundreds upon hundreds of small fish fins poking through the water, especially in July and August. Thus thousands of fish for the Osprey to feed on. We have several dozen Osprey nests/ man made in our area, specifically on Kelsey Island, which I am directly across, as well as up and down the river and the protected estuary here in East Haven, Connecticut. I am a steward for the Osprey nests, as I monitor during the nesting season. I have noticed a considerable drop in fledglings. The last two summers I see virtually no fish visible like I had seen 5 years ago. I do see the Osprey overhead carrying their catches so I know there are some fish in the river, but not the abundant amount that used to be just a few short years ago. I am very concerned for the Osprey population that nest in this region, as I absolutely believe that the lack of available fish is effecting their reproduction success, and thus their survival. I think a moratorium, or some kind of organized reduction on commercial fishing would be a huge benefit to not only the Osprey, but many other species that need those fish to survive.

Dear Members of The Atlantic States Marine Fisheries Commission:

I am writing to you today with an urgent request that you reduce the Chesapeake Bay menhaden fishery cap by 50%. You are in a position to make a decision that will create sustainable practices for fisherman and wildlife alike. Please consider both environmental and commercial interests as you make this decision, knowing that you shape the future for a species of protected bird, the osprey, to survive or perish.

As a wildlife photographer and environmentalist, I have photographed ospreys at multiple nesting locations along the east coast from Maine through New Jersey. Osprey thrive when the menhaden runs are plentiful. There is majesty in first hearing osprey, who mate for life, call to each other from great distances, then to see these beautiful birds carrying a menhaden to their nest, and then share a meal. Unfortunately, this year was incredibly difficult and the menhaden were not abundant. Instead of watching osprey families thrive and chicks fledge, we watched, live on camera, as chicks dwindled and starved to death. Only 1 in 4 nests were successful.

I am asking you to consider the impact of the decision you make. Commercial fishermen will still be able to make a profitable and healthy living, and osprey populations can also thrive. However, we need to make conscientious choices about protecting our vulnerable species. Please, reduce the menhaden fishery cap by 50%.

Sincerely,
Dr. Jason Scavotto

I'll keep this brief...
GET THE INDUSTRIAL MENHADDEN INDUSTRY BOATS OUT OF OUR WATERS! They do not belong in our economic zone nor Federal waters! They are depleting a critical marine food web source. Our osprey chicks are starving, our striper numbers are being reduced and us recreational fishermen (and my commercial friends) are barely seeing the bunker pods in the ocean where we are used to seeing them in abundance previous years.

It's not the recreational, sport for hire or commercial fishermen that are responsible for the rapid decline in numbers. We have all fished here for decades. It's the industrial boats that are destroying not only menhadden, but herring and any other bait fish they can 'strip mine' from our sea.

OUTLAW INDUSTRIAL MENHADDEN FISHING. PERIOD.

Option C1e: To reduce the Chesapeake Bay CAP by at least 50 percent in 2027 and link any changes to the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).

As someone on the water in the Chesapeake Bay day in and day out, I have witnessed firsthand the severe ecological decline driven by the industrial reduction fishery. While cutting the Chesapeake Bay Cap is a decent start, we need to be working toward a full-on ban of reduction fishing in the Bay.

The impacts are impossible to ignore:

Stunted Forage Base: The menhaden themselves are smaller than I have ever seen them, starving the ecosystem of the foundational energy it needs.

Crashed Predator Fisheries: The cobia population has dropped off dramatically, the striped bass fishery has been effectively gutted, and local ospreys are increasingly unable to find enough food to successfully raise their chicks.

The "Zero Bycatch" Myth: While industrial operations claim zero bycatch because certain species aren't brought over the rail, that is simply not the reality on the water. When purse seine nets wrap up a massive bait ball, everything feeding on it gets trapped. I have personally come across dead, floating cobia, red drum, dolphin, turtles, and so on after these nets have been pulled—suffocated in the set even if they aren't officially logged as boat bycatch.

We cannot continue to manage this critical forage base as if the Bay's ecosystem is limitless. We need to support substantial cuts now as a step in the right direction, but our ultimate goal must be completely removing industrial reduction ships from the Chesapeake Bay. I grew up with this fishery and want my kids and future generations to be able to enjoy a health fishery. its time we start prioritizing conservation over greed and money.

Best option is to move Refuction fishing out of the Chesapeake Bay

Omega will not close their Reedville plant.itt is an empty threat

Please support Option c and reduce the amount of Menhadden removed from the Chesapeake bay

Virginia officials are too corrupt to take action

Hello:

I support the complete end of the fishing of Menhaden until a survey has been completed and an action plan to protect the Menhaden and the bird and other wildlife has been agreed with communities. One greedy company cannot be allowed to destroy an important resource that other species depend on. Conservation is in the interest of the company as well, to ensure the long-term sustainability of its fishing effort.

Over the last decade or so the abundance of Striped bass, speckled trout, croaker and other popular species in the Chesapeake bay have declined. The best fishery on the east coast has been decimated by a severe lack of forage fish, (menhaden) which many attribute to the commercial harvest by a foreign owned company operating in the Virginia portion of Chesapeake Bay. Many Virginians believe that these commercial fishing operations which aren't allowed by our neighboring states sharing the bay have destroyed the recreational fishery, livelihoods of charter fishing operators, boat dealers, tourism, and sent business to other states. It should also be noted that birds of prey have also declined while Virginia politicians fail to act to restore what's been lost. This issue needs national attention to remedy the exploitation and abuse of our natural resources.

I support the following!

3.1 Chesapeake Bay Reduction Fishery Cap Amount

Option C1e: To reduce the Chesapeake Bay CAP by at least 50 percent in 2027 and link any changes to the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).

Option C2a: To set the maximum upper limit in any future change at the current level of 51,000mt.

3.2 Chesapeake Bay Cap Distribution

Option B2: To establish three even length quota periods for the Chesapeake Bay Cap, distributing the harvest at 25% in period 1, 25% in period 2, and 50% in period 3.

Option B: Provides any underage of Quota Periods 1 or 2 be rolled into Period 3 of the same fishing year. Any underage in

Quota Period 3 would not be reallocated. Any overages would be deducted from the same quota period in the following year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision

Option B: Revisit the Chesapeake Bay Cap every 3 years.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

As a fisherman primarily in New Jersey it would benefit the recreational fishermen if the commercial fishery for menhaden was moved outside of a 25 mile limit. Commercial boats have been taking ALL the menhaden (bunker) that striped bass feed on . This bait is vertically wiped out as these boats sometimes 4 to six in a row take everything in their path. The recreational fishermen are left struggling to make a catch. It's high time these commercial fishermen contribute.

In my opinion, all Medhaden fishing should be moved at least three miles offshore. I am 82 yeasrs old and have been fishing the Chesapeake bay since 1965. My family and I have enjoyed many good years and also some lean years fishing the middle bay.
Since Katrina, when the company consolidated their Gulf of America fleet with the one in Norththumberland county, the catching has dropped significantly. While the Medhaden fleet is not supposed to enter Maryland waters, I have observed them on several occasions when they come well north of Smith Point light. I have been a property owner for many years and pay plenty of taxes ,not only on my home, but my boat as well.

Not sure what all the tax revenue goes to in Northumberland county, but I have a serious problem trying yo get my boat thru the jetty at Sunnybank. It needed to be dredged several years ago.

We live in Ocean City, NJ and have several stands for osprey nests behind our home. They were always occupied. They produced many offspring. When boating, we also saw most of the channel markers that could sustain a nest were full as well.

This year there are zero nests. Zero babies. That is a 100% decline in our area. It sounds like the rest of NJ is seeing the same problem. This isn't acceptable. If we see an osprey (and it has been rare this year) they aren't in pairs. This sounds like an environmental crisis and it needs to be handled immediately. The menhaden fishing needs to be stopped until the environment recovers.

I have seen dolphins in the bay behind our home this year. I've lived here almost 30 years and have only seen them twice back here over all of those years. Now this year they are frequent and neighbors in other parts of our town are reporting them in their waters as well. Are they starving and chasing any fish they can find?

Please do the right thing and put in immediate restrictions to save our ocean and wetlands.

I have lived on the Connecticut shore for over 60 years. Over the last 30 years I have watched with joy as Osprey found their way back to Long Island Sound and thrived, with the number of nests and birds increasing dramatically through the last few decades. This year, it was clear that many nests in my town had failed, and by August almost the entire Osprey population had abandoned their nests. Where there had been almost 2 dozen birds hunting daily in June, there was one lone Osprey left the second half of August. These are magnificent birds, whose recovery from the 60s has been a dramatic and wonderful success. We must protect the menhaden fish stock so that they can continue to thrive.
Menhaden are key to the survival of Osprey and many other birds and marine mammals. The time to protect the Menhaden population and the Osprey population is now and we must take strong action. I strongly urge you to reduce the Chesapeake Bay menhaden fishery cap by 50%.
Thank you for your consideration.

I am writing due to our great concerns about the sudden drop in the Osprey population around our home and waterways. As a lifelong resident of Ocean City, NJ, I have watched the osprey numbers grow to a point where every stick built nest stand behind our home was occupied, as well as most of the channel markers that were able to sustain a nest. All seemed to have babies and we watched them learn to hunt for years. Last year at least one stand wasn't occupied, and this year no nests. No channel markers have nests either. We see almost no osprey when we are boating, and never in pairs. All of our friends are asking as well. We have never seen it like this since the DDT era. The environment is crying.

My understanding is this is due to menhaden fishing. If so, this is catistrophic. How can they disappear so quickly. Will the whales and dolphins be next. I've notices dolphins behind our home where they were almost never seen. Please take this as a serious warning and cut off the menhaden fishing immediately. Implement strict controls once the population rebounds. It is horrible that this has been allowed to happen, but you are in a position to stop it.

Without our oceans we are nothing.
I speak on behalf of many people in asking you fix it now.

Thank you,
Lori Huck, as well as friends, family and neighbors of the bayfront community

I am 77 years old and have been fishing in NJ since I can remember. I did a lot of offshore fishing for 25 years and would see the osprey nesting on the inland water way markers. We used the bunker for bait and would snag a few in the midsummer and fall. The last two years have been the worst that I have seen. They always go in cycles of abundance about every 5 years. I do remember seeing the bunker boats with the high towers about three to five miles out up until about the late 90's. I also remember the bunker nets in the Raritan Bay head waters in the 70ts. The bay water, Little Egg Bay, where I keep a boat has been very warm 87-88 degrees with the ocean at 78 degrees 10 degrees warmer than usual the last two years just about the time when we would see the peanut bunker. There were no Peanut bunker the past two years, and very few large spearing. The last two years the whales have not come inshore, three to five miles, since the large schools of bunker that are usually there from July to October haven's been there. I don't know if the Chesapeake bunker migrate up to NJ.
I really think the bunker are a local stock from the Delaware to the Raritan but reducing the catch from Virginia of millions of pounds certainly will not hurt. hopefully the stock will rebound in a couple of years.

No farm would survive killing young of a farmed species. This is essentially what is going. Menhaden are a food source for many species. Many species have crashed (grey trout comes to mind) do to lack of food. In the1970's we had 8-15 Bluefish all over the Chesapeake Bay. Personally the fishing for menhaden should be closed in the bay, no fish taken until after they have bred at least once, preferably twice.
Thank You,
William Roberts

I've followed Osprey nesting in my Hampton, VA area over the last decade and noticed their faltering appearance over the last 3-4 years with no successful nesting the last 2 years at two sites I check regularly on Ft Monroe. I believe this decline in Osprey breeding correlates with the decline of their food sources (often Menhaden in the Bay) around Ft Monroe.

I would endorse any reduction in the human harvesting of Menhaden (such as the Atlantic Menhaden Draft Addendum II) which would help bring back their stable Bay population and the attendant natural predators like Osprey and Striped Bass. Suspect continued commercial harvesting at current levels will likely reduce the Menhaden population to uncommercial levels anyway in the next few years.

I strongly oppose unlimited menhaden fishing in the Chesapeake bay! The current limits are decimating the wildlife, and in particular the Osprey population. As a Virginia Master Naturalist, I am extremely concerned about the health of the bay in general. While I do not oppose commercial fishing in the bay, there need to be strict limits. Clearly the current menhaden limits (if any) are much too high!

Peter S. Thiringer
Vienna, Virginia

P.S. Why is a foreign company being allowed to remove our precious and limited natural resources, harm our wildlife and ecosystem, and take the spoils out of the country? This makes no sense. What does Virginia get out of this arrangement?

This comment concerns NY & NJ, since many anglers, like myself, from NY, also fish the NJ Coast. I would like to urge your support for a 50% reduction in menhaden commercial quotas. And In addition, I would urge your support for a 12 miles from shore restricted zone for commercial quotas, spanning both the NY AND NJ coastlines. Menhaden are critical for all sport fish and other commercial species in the Northeast and there appears to be a scientific correlation between healthy fish stocks and healthy menhaden populations. Please use current, unbiased science to base your conclusions and not on outdated nor anecdotal evidence since these may be incorrect or biased.
Thank you. Please do the right thing for me and generations to follow.

As a foundational species throughout the Northeast coast , Menhaden abundance is crucial to the success of multiple fish stocks and other marine species . The downstream effects of the current quotas allowed to the ' reduction' fishery have been painfully obvious, for far too long . Halving their quota , not just in the Chesapeake Bay Area, will treble the economic value realized by commercial fishermen . As well as enabling the restoration of stocks of depleted species , some caught as bycatch, and benefiting many marine species , from cetaceans to pinnipeds, ospreys to shearwaters . This isn't rocket science or brain surgery . If we let enough of them live , they'll do the rest .

This has to end…so many marine species, along with shore birds are reliant on this food source. Allowing these netters to continue this will result in long term effects. We as a human race seem compelled to abuse every resource, and this is no exception. Please put an end to this. The bycatch by these ships is astounding, and the waste gets dumped overboard dead.
Sincerely concerned,
M Szymanski

Been a life long fisherman and bait man. I am also a biologist who works with wetlands and coastal permitting, SAV studies and Shellfish studies. I live on the Barnegat Bay and every year there are less and less baitfish. The state of the bay is not good. Over 40 years typically one baitfish picks up while others recede and the last 10 years every baitfish is less. Less eelgrass, less un disturbed shallows, and more people relying on fish for a lot of things other than food. We notice a lot of bunker boats the past 2 years, circling entire schools and removing them. It cannot be good. The commercial guys killed the weakfish doing the same thing. There are so many people on earth unless there are quotas there is no way you can protect these fish. Commercial and recreational all need a better quota.

As a biologist, fisherman and viewer of baitfish and Osprey I am disturbed by the the lack of menhaden and the pleasure of watching Ospreys dive and catch this baitfish. I am fortunate to watch this beautiful natural phenomenon from my waterfront house in Old Lyme,Ct..The reduction of this natural phenomenon is measurable.
I was also most fortunate as a young person with a 13 ft boat docked at the Black Hall Marina in Old Lyme to be approached by a gentleman to help him bring lumber to Great Island for a construction project which was Os
Prey nests. For gas I was happy to do this and down the road I discovered that he was Roger T. Peterson. My subsequent Masters Thesis in 1970 was on the ecology of an estuary .
I don't know if the reduction of baitfish is just an aberration or is related to overfishing at their origins or pollution but I do know that something is not right and thanks to our Audubon friends and I bet Roger T would be proud.Thank you,
George Finley

This is another Disappointing Disaster as many species of fish have vanished.Menhaden, Weakfish, Kingfish, Blowfish, etc.… Growing up at Cape May Point, New Jersey, for sixty nine years plus, the numbers of fish have diminished. I personally feel nobody is doing any form of conservation efforts or research. There is never any form of publicity regarding fish… There's something seriously wrong with the ecosystem and environment. As Overfishing is another issue not presented. Since the disappearance of many species of fish, other fish are brought to our table, now Like tilefish, sheep heads and other species. I am very concerned about many species disappearing, especially Menhaden, Weakfish, Kingfish and other species I grew up with. Please keep Publicizing through the News Media, Social Networks and other forms of interaction. John Reilly 609 707 0262

Ban all reduction fishing. It is crazy to allow any companies, but especially foreign companies to devastate the food base for wild fish, mammals, and birds to make fish food that is also largely sold overseas. The menhadden population could collapse and you will be responsible.

Do you want to risk collapse or manage for abundance?

Do the right thing

I believe it is imperative that the ASMFC strongly consider reducing the Chesapeake Bay reduction fishery cap by up to 50% and creating quota periods to distribute harvest under the cap more evenly throughout the fishing season. The other species of fish who rely on menhaden are so much less visible to the average person living or visiting the Chesapeake Bay. For 3 straight rockfish seasons, charter fisherman making their living on the fishing season, are unable to do charter trips because there are no rockfish. I strongly believe that reduction fishing is destroying the equilibrium of our treasured Chesapeake Bay. If we do not limit menhaden reduction fishing now, it may be too late.

There needs to be a moratorium to take the pressure off these fish for a 3-year period, if there isn't. Bluefish and striped bass stocks will continue to disappear. It's very apparent the damage has been caused by Omega and I as well as others who have stood by and watched this happen understand what the fisheries council, which is top loaded with commercial fisherman like Omega, have depleted and damaged not only the biomass, but have caused charter fisherman and recreational fisherman, who contribute billions of dollars in economic activity to my state real and unrecoverable losses.
Even the recreational crab boating business in the bays have gone out of business due to the relentless pressure and price of bait. Do something, anything.

Menhaden are the Most Important Fish in the Sea because they are the primary food for many fish and birds that breed in salty water. In the Chesapeake Bay, Striped Bass, Osprey and many other species depend on them to survive and breed. The Bay is the largest nursery on the east coast. Omega chases every school of menhaden with 7 spotter planes and 6 ships with huge stadium size nets, catching everything migrating in and out of the Bay. They grind all these fish and use them to feed farmed salmon in Canada. Every day this happens. Virginia needs to stop allowing this. Our river and lakes in Virginia are drying up because of the severe drought making it even harder for the Osprey to nest and find food. Every year we are seeing less and less Striped Bass come through the rivers here. We need to stop this before it's too late. As time goes on more overfishing is happening with no one putting a stop to it. It's bad enough there are hardly any regulations in ocean fishing, especially for certain species, but it all trickles down the food chain. If Canada wants to feed their fish farms, or anything else for that matter, let them do it near their home instead of coming here destroying our wildlife without a care in the world. Please do not let this continue! Put a stop to it before it's too late and we all pay the consequences for these actions!

I am writing to say that something must be done immediately to stop the overfishing of menhaden on the Atlantic coast. This overfishing - which is apparently being done by a single Virginia-based company, Omega Protein - is having a devastating effect on Chesapeake Osprey, who depend on menhaden to feed their young. Thousands of chicks are starving and many adults are not breeding at all due to the shortage of menhaden. Fledging success for 70% of Bay Osprey has dropped to a catastrophic 0.25 per nesting pair in 2026 which is well below the ideal replacement level of 1.15 and LOWER THAN THE WORST YEARS OF DDT-CRASHED REPRODUCTION IN THE 1960s! This data is from biologists surveying 900 nesting pairs throughout MD and VA Bay waters. Other bird species, such as Bald Eagles, Brown Pelicans and Common Loons are also being affected, as are fish species of conservation concern such as rockfish and bluefish.

The Omega Protein industrial harvest takes 70% of all harvested Menhaden on the Atlantic Coast! This is neither sustainable nor equitable and is greatly harming life on the Chesapeake Bay. Omega's overfishing practices MUST BE STOPPED at once. Industrial menhaden harvest should be shut down completely until a study is completed on the viability of the Bay's menhaden population and a sustainable system of harvest is developed.

Action must be taken NOW! The survival of the Chesapeake Bay depends on it!

I strongly encourage the reduction in the menhaden quota in the Chesapeake Bay. As a recreational fisherman for over 60 years I have witnessed the destruction this fishery has done to recreational as well as commercial fishing in and around the bay. I have personally witnessed the bi-catch damage as well.

I am writing in support of a lowered quota on Menhaden along the Atlantic seaboard. I have been monitoring several Osprey nests along the coast for Connecticut Audubon's Osprey Nation citizen science program, and have seen dramatic drop-offs in nest productivity over the last two years. Three of my nests combined to produce seven young that fledged in 2024. In 2025, those three nests dropped to a total of two fledged young. In 2026, they produced no young at all.

Other nests that I monitored this year produced a total of five young across three nests, with two producing only a single fledged juvenile. This likely indicates that either the female Osprey didn't catch enough food during the spring to produce more than one egg, or that the adults were not able to provide enough food to support more than one chick to fledging - one of the nests that fledged only one juvenile had two or three young at one point, but only one survived. Also, anecdotally, I saw fewer Osprey carrying big Menhaden back from Long Island Sound this year than in the past, particularly later in the season, when they were seen carrying only smaller fish.

In 2025, Connecticut's nest monitors heard about the dire situation with Osprey around Chesapeake Bay, so we were apprehensive entering the 2026 season. Sadly, our apprehension appears to have been warranted. We're all hoping that a reduction in the Menhaden quota to allow the population to recover will have benefits up and down the food chain, both in

keeping the algae and smaller prey species that Menhaden feed on in check, and helping larger predators, including Osprey, that depend on Menhaden for their survival.

Connecticut Audubon is urging the commission to reduce the fishery cap by 50 percent, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Ospreys, are not put in even greater jeopardy.

Last year, Connecticut Audubon's Osprey Nation recorded its lowest breeding success since the statewide community science program launched in 2014 to monitor the birds. This year is looking even worse.

I support the Connecticut Audubon and its efforts to save our ospreys which are literally starving. Our state and indeed the entire planet desperately needs our bird population which is endangered and dying by the billions. Please help us save them!

At a minimum, we should enact a 50% reduction. A moratorium should be placed on fishing by companies like Omega until we have secured data indicating that they are not actively pillaging this natural resource. Our fisheries are declining and capitulating to corporate interests will lead to the destruction of our fisheries and the wildlife that depend upon them.

As a person who loves the Jersey Shore and also someone who loves Osprey and I am a dedicated Osprey Nest Watcher, I can tell you that the effect of the lack of bunker fish is frightening. And dangerous to our osprey populations frst hand. Please do everything you can to support a sensible and reasonable use of the bunker fish populations. And stop the enormous capture of these fish during the very brief season that the one company that captures them des during the early summer. Osprey are like what people used to say about the Canary in the coal mine - they are an indication of our coastal health. And, we are in trouble. You have to regulate this important fish population - to protect not only the osprey, but also the Jersey Shore and the entire eastern coast that we love. Thank you.

We need to do something to reduce the menhaden fisheries current practices. I've seen first hand the reduction in Osprey nests, chicks in our town. We once saw a flourishing community of Ospreys that every morning and evening would catch fish to take back to the bay. We now see Osprey circling the ocean over and over again without any fish. This fishery needs to be managed differently in order to stop the downstream impacts to other species. Thank you

Thank you for the opportunity to chime in ... the overfishing of menhaden is not only adversely affecting the fishing in area but it is also adversely affecting the food supply of the Ospreys, Eagles, and other fishing birds in the area. As the General Manager of the Borough of Fenwick, I can clearly see the decline in fledglings from the Osprey stands over the last few years.

Thank you ~

Our family has fished the bay for decades and watch osprey most years nest within site of our window facing a Rappahannock tributary. The nest has been abandoned for 3 consecutive years. Our catches of sportfish are plummeting. I feel like we moved to the Dead Sea. Our government has been irresponsible in allowing so many metric tons to be harvested, particularly at the mouth of the Rappahannock. We tell our grandchildren about what it once was, as if it is some fairy tale. This can be fixed through responsible resource management! Thanks for your consideration, Heather Freeman

The decline in menhaden in Long Island Sound adversely affects Ospreys, gulls, and terns as well as pelagic birds. Please do not decrease the cap on harvests; in fact an increase in the cap is important at this time. As a birder who lives near the Milford shore who has many fishing friends, the problem of the loss of menhaden has been painfully obvious.

This analysis by the Center for Conservation and Biology at William & Mary concludes that the lack of fish food for the osprey is the primary reason for their low birth rate, which is significantly below the ability to maintain a stable population of ospreys. The survey's press release is below for your review. I hope you will consider reducing and or eliminating the menhaden catch in the bay and around the mouth of the bay. Thank you for your consideration.

Study says Chesapeake Bay Osprey reproduction falls to record low in 2026

September 16, 2026
|
Daily News Headlines
Image
Osprey reproduction in the Chesapeake Bay fell to the lowest level ever recorded during the 2026 breeding season, according to new monitoring results from the Center for Conservation Biology at William & Mary.

Researchers monitored 937 osprey pairs across 23 study areas stretching from tidal freshwater portions of the Chesapeake watershed to waters near the mouth of the Bay. The monitoring was conducted from March through August to measure nesting success and the number of young produced.

The results showed a sharp difference between osprey nesting in freshwater areas and those in saltier portions of the Bay.

Among 769 pairs nesting in waters with salinity above five parts per thousand, average productivity was just 0.25 young per pair. Researchers say osprey populations generally need to produce between 0.8 and 1.3 young per pair each year to remain stable.

By comparison, 168 nests monitored in tidal freshwater areas produced an average of 1.04 young per pair, exceeding the minimum level considered necessary for population maintenance.

The study found that 81 percent of osprey pairs in the saltier areas failed to produce any fledged young. Productivity in those portions of the Chesapeake has declined from 0.51 young per pair in 2024 to 0.35 in 2025 and 0.25 this year.

The Center for Conservation Biology says those numbers raise concerns about the long-term Chesapeake Bay osprey population, which has historically been one of the largest breeding populations in the world. Based on current reproductive rates, researchers estimate the breeding population could decline by an average of about 14 percent annually if conditions do not change, potentially resulting in a roughly 50 percent decline over the next decade. Researchers note, however, that the rate of decline would likely vary considerably across different portions of the Bay.

Researchers attribute much of the recent nesting failure to what they describe as food stress. Among the evidence cited are reduced food deliveries to nests, underweight chicks, smaller broods, abandoned nests and documented cases of chicks starving.

The Center says declining availability of Atlantic menhaden appears to be an important factor. Menhaden have historically been a major food source for Chesapeake Bay ospreys because of their abundance, schooling behavior and high energy content. In some areas, researchers report that delivery of menhaden to osprey nests has declined by more than 80 percent since the 1980s.

However, researchers say the underlying reason for the reduced availability of menhaden to ospreys remains uncertain.

The Center lists several possible contributing factors, including climate change, commercial fishing, changes in where menhaden are distributed and the possibility that large numbers of the fish are entering the Chesapeake later in the summer. The researchers did not identify any single one of those factors as the definitive cause.

Other factors can also contribute to osprey nest failures, including storms, predators, human disturbance and heat stress. The Center says the patterns observed during the 2026 season were most consistent with widespread food shortages rather than those other causes. Other studies have linked increasing eagle numbers with declines in ospreys, potentially through territorial aggression or predation. But this study said there was no evidence that competition with eagles for fish or nesting sites was responsible.

Coldwell Banker Harbour Realty
The monitoring included study areas throughout Virginia and Maryland, including the Bayside Eastern Shore, Mobjack Bay, the York, James, Rappahannock and Potomac rivers and other portions of the Chesapeake watershed.

The project included contributions from the Center for Conservation Biology, U.S. Geological Survey, Virginia Department of Wildlife Resources, Virginia Aquarium and Marine Science Center, Washington College and several other conservation organizations.

The findings continue a broader research effort examining whether declining reproductive success in saltier portions of the Chesapeake represents a long-term threat to the Bay-wide osprey population.

Atlantic Menhaden are a CRUCIAL forage species food source for many Atlantic Ocean predatory species (from fish to birds). They are essential food sources for: ospreys, eagles, whales, porpoises, striped bass, bluefish, weakfish, and many other species.

Their rapid population decline has been detrimental to the productivity of osprey nests, leading to high chick mortality across the coast. Osprey populations have suffered enough during the era of 4,4-DDT use, and have stabilized and flourished after the banning of the pesticide. Current osprey reproductive rates are now below 50% and are expected to continue an annual decline of roughly 14% per year. So why, specifically, are we concerned for the loss of osprey populations? They are a crucial bioindicator of our coastal ecosystem health, as they are a top predatory species. If their populations decline, that means there is a problem with the health of our rivers, bays, and estuaries.

These numbers will only be compounded by rapid climate change, pollution and habitat loss due to development. This year I have seen a massive decline in osprey nests along the many rivers, estuaries, and coastline of southern New Jersey. It has been alarming to say the least. But this decline has been occurring for much longer than a year. Ospreys have been extensively researched for decades- pesticide usage on egg viability, food scarcity, high-salinity areas vs low-salinity areas,

etc.

Humans can rely on Omega-3s through other sources, ospreys can't find another. Please consider distributing the harvest periods and decreasing the cap to the maximum amount possible so we can save not just the osprey, but all the other species of our coast.

I live near LIS and this year we are seeing no schools of fish in the water . The Osprey that nest nearby had great difficulty feeding their 2 chics . One died early .... ? starvation ???
The one remaining chic was killed and eaten by a bald eagle and the adults were not there to protect the chic . They were probably trying to find food .
Seems that something needs to be done quickly to save the Osprey population .
I also understand that there are porpoises in LIS this year as well . They might be impacting the fish population in the sound .

The rebound of Osprey's has been a success story. I would like to see the Manhattan Lowered by 50% so that not only Osprey, but eagles, bigger fish and other animals will all benefit from a healthy and bountiful fish hatchery and environment. We must protect the bait fish if we are to protect all of the species that depend on them. And, it's an easy thing to do by lowering the cap by 50%.
Thank you

Dear Members of the Atlantic Menhaden Management Board:

I am writing to express my strong support for the management options within Draft Addendum II that seek to significantly reduce the Chesapeake Bay Reduction Fishery Cap (Bay Cap) and establish better spatial and temporal controls on the industrial reduction fishery. The Chesapeake Bay serves as a critical primary nursery area for Atlantic menhaden. Because menhaden are a foundational forage fish, maintaining their abundance within the Bay is absolutely vital to the entire marine ecosystem. Countless predators—including striped bass, osprey, cobia, red drum, and marine mammals—rely heavily on menhaden as a primary food source.Currently, the concentrated effort of the industrial reduction fishery inside the Bay threatens local ecosystem health and negatively impacts other regional fisheries. I support an immediate reduction of the Bay Cap by the maximum proposed amount of up to 50%. Furthermore, I strongly favor options that distribute the harvest cap more evenly throughout the fishing season. This will prevent intense spikes in localized depletion and ensure adequate forage remains in the water during critical summer months.Thank you for your dedication to the responsible, ecosystem-based management of our shared marine resources. I urge the Board to approve a robust reduction of the Bay Cap to safeguard the long-term ecological health of the Chesapeake Bay.

Best Regards,

Patrick R. Callahan

I'm 57 years old and have spent my life on the bay and rivers in Virginia. I grew up on the Lafayette and Elizabeth rivers when there was Kepone contamination and guidelines against consuming any fish or crabs. I cant believe after all these years of recovery for the rivers and the bay that the State of Virginia has not protected the fishery and sustains a great portion of the food chain. I have watched the Osprey population in the Deltaville area go from a nest on every stand to none this last season. In the absence of Menhaden the larger game fish consume more juvenile crabs affecting those stocks. Another study by the State is a weak excuse for delaying the responsibilities placed with them to manage our fisheries. Menhaden are the backbone of the bay's food chain and the greed that has decimated this fishery needs to be confronted and stopped. Shame on us all for not stopping it sooner.

I am a retired high school science teacher, and ecology and biology were my main subjects. I care deeply about the natural world and in particular the natural world my students will inherit.

That being said, since retiring I have been an active member of Osprey Nation, working with CT Audubon to track the local osprey population. And I can say, unequivocally, that our local population is suffering. This year I have tracked failed nests and a much lower fledgling count than in the past. Where nests last year would have 3 - 4 fledglings, this year I see 1, or even none, from pairs that have, in the past, been successful parents. And while I live on the Housatonic River, and used to watch osprey fish here, I have not seen a single bird flying by with a fish to feed its young. Something is happening to the fish population and it is starving out the osprey that depend on them.

Menhaden fishing must be regulated, and closely, to bring back the wildlife that depend on them.

The harvesting of menhaden off the coast of New Jersey and New York has to stop. It's decimating the fishery and the ecosystem.

There's been a clear reduction in the amount of bunker and it's already impacting the striped bass fishery as well as the tuna fishery.

It's a travesty that were allowing these bunker boats to come in and pillage this critical resource

As a citizen scientist volunteer with the CT Audubon Osprey Nation program for the past 8 years I was appalled to witness the precipitous decline in the productivity of our nests over the past 2 years. It was heartbreaking to see chicks starve in the nests abandoned by their parents due to the disappearance of once abundant schools of menhaden in Long Island Sound.

As you know, osprey served as the canary in the coal mine when their population was decimated by the ill effects of DDT not so long ago. Today, the commercial over harvesting of menhaden is decimating the osprey population that once again serves as an early indication that the ecosystem is endangered due to human activity.

I urge you to take immediate action by meaningfully limiting the commercial harvest of menhaden.

I support stronger protections for Atlantic menhaden, particularly in the Chesapeake Bay, because menhaden are a foundational forage species that support the health and productivity of the entire ecosystem.

Chesapeake Bay osprey populations have experienced documented declines in breeding success in several regions of the Bay. Scientific research has linked these declines to reduced availability of high-quality forage fish, including Atlantic menhaden, during critical nesting periods. Ospreys rely heavily on menhaden to feed their young. When menhaden become less available, adult birds are forced to travel farther for food and often substitute lower-quality prey, resulting in slower chick growth, lower fledging success, and increased nest failure.

The ecological consequences extend beyond ospreys. Menhaden are a critical food source for striped bass, bluefish, weakfish, dolphins, bald eagles, pelicans, and numerous other predators. Excessive localized removals of menhaden from the Chesapeake Bay can reduce forage availability for these species even when coastwide harvest limits are met. This is especially concerning in a nursery and feeding area as ecologically important as the Chesapeake Bay.
Menhaden also provide valuable ecosystem services through their filter-feeding behavior, helping cycle nutrients and improve water quality.

Protecting adequate menhaden abundance supports not only fisheries, but also the broader health band resilience of the Bay ecosystem.

For these reasons, I urge the Commission to adopt precautionary management measures that account for localized depletion, ecosystem needs, and the forage requirements of dependent predator species. Management should ensure sufficient menhaden remain in the Chesapeake Bay to support healthy populations of ospreys, striped bass, marine mammals, and other wildlife that depend on them.

The Chesapeake Bay should not be managed solely as a source of harvestable menhaden biomass. It must also be managed as critical habitat where sufficient menhaden remain available to sustain the birds, fish, and marine wildlife that make the Bay one of the most important ecosystems on the Atlantic coast.

Dear Sir:

I am respectfully requesting that the Atlantic Marine States Fisheries Commission reduce the cap on Menhaden fishing by 50%.

By so doing, the Commission will aid in keeping an ecological balance necessary to preserve feeding stock for ospreys. I live in Connecticut, and despite efforts to bring back the osprey population in our state, 2026 has seen the lowest breeding success in the past 12 years.

I appreciate your time and consideration of my comment.

These fish are a major food source for many pelagic species, they also filter feed so they help maintain clean oceans.. The Atlantic menhaden are being over fished for things like makeup, dog food and fertilizers, I'm sure much more. I feel this needs to stop for there has been a drastic decrease in Atlantic menhadden populations.. the fishermen are also catching other species as a by catch and killing many fish that are hunting these fish for food. So not only are the menhadden getting whacked but the fish that I and many other people spend thousands if not hundreds of thousands to pursue the fish that are eating the menhadden. Something needs to change to stop this process thanks

Comment

I write to urge the commission to reduce the fishery cap by 50 percent, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's ospreys, are not put in even greater jeopardy.

Last year, Connecticut Audubon's Osprey Nation recorded its lowest breeding success since the statewide community science program launched in 2014 to monitor the birds. This year is looking even worse.

Osprey and other species that rely on menhaden do not have years longer to wait. Decisive action is needed now.

Thank you!

I strongly support reducing the fishery cap by 50 percent to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Ospreys, are not put in even greater jeopardy. In 2025, Connecticut ospreys had the lowest breeding success since 2014, and this year is looking worse. Their food supply, and many others who rely on menhaden as a food source, is in jeopardy due to overfishing and we must protect these creatures while there's still time for the menhaden population to rebound.

Please consider reducing the Chesapeake Bay reduction fishery cap by up to 50% and creating quota periods to distribute harvest under the cap more evenly throughout the fishing season to address concerns about ecological impacts.

Please take precautions and reduce menhaden limits. Our ospreys are suffering.
I've live 13 years on the Indian River/Eastern Branch of the Elizabeth River. I'm not seeing the population I used to.
So many species we have ignored in decline Have posthumously taught us their importance as other things fly out of balance.
We've overdone harvesting—and who knows what else.
Let's try to slow this decline before we learn yet another hard lesson.

I have lived on the Connecticut shore for the last six years. For the first few years, menhaden were everywhere in Wilson Cove. You could see them in very large schools. In the last two years, they are nowhere to be found. Something has changed drastically in the recent years to diminish the population

It is imperative that caps be put on overfishing of the manhaden fish. Without sufficient quantities of these fish, the larger fish can't survive and reproduce.

I am an Osprey Monitor and have been for 8 years. I monitor 4 platforms, all of which have been successful until last year. Last year, one platform was abandonded. This year, two of my platforms didn't get enough fish to raise any fledglings, and the one that did succeed, who alsways have had two, only raised one. After the success of bringing back the Osprey, this is hearbreaking. The Osprey depend on Menhaden. I also kayak, and have seen large schools of Menhaden in the past, but not the last two years.

I live adjacent to a salt water marsh in Old Saybrook, CT. For at least 6 years I have monitored 5-6 Osprey nests as part of CT Audubon's Osprey Nation. These nests have averaged between 2-3 sucessful fledgings each up until a year ago. Last year I had one fledgling, this year zero!
There was a nice River Herring run this spring and all pairs appeared to be eating well and all appeared to go into incubation. Herring run seemed to be over just when nestlings should have started feeding. Large schools of Menhaden in years past would have shown up, this year nothing. Adults were showing up with little or no fish.
Small local commercial fishermen who supplied Menhaden for bait shops all said what small schools showed up last year and this year were difficult to find and fish were 4-6" instead of 10-12".
Unless something is done this year I am afraid our coastal Osprey populations will crash.

Please put proper fishery restrictions in place to allow the recovery of the osprey population and other species that rely on this fishery. Osprey are a critical puzzle piece in our ecosystem on the eastern seaboard. Their feeding habits reduce the number of diseased fish in the wild, and keep small prey populations under control naturally. They also help to signal the strength of their prey populations, clearly there are not enough menhaden, which in turn will affect the whole food web with a domino effect decline from Striped bass, and tuna to humpback whales and dolphins. Nature is resilient if we help it with less greed.

Watching how this process goes year after year, we continue to think that over fishing and letting other countries deplete our own resources, and listing that there are no issues with this fishery, makes one wonder who really understands how to manage true levels.
I was always taught this type of management means someone isn't doing their job. Fire drills of this level should never happen with today's technological advancement's we have at our finger tips.
One wonders who really has the input on where this type of decision we'll end. It's like adding a red light at that treacherous traffic corner where many people have died before we think we needed a traffic light.
Well let's open our eyes wide and look at the effects these past open seasons have done. Let's shut down outside influence and return the levels of these fish, that affect a tremendous amount of other species, back to healthy sustainable levels.
We shut down stripper Fishing completely in the past I would suspect we should do the same for menhaden for none fishing use.
Thank You

We need to help our birds. I have seen this first hand. Their food source isn't enough for them to feed their young. Many babies and young birds have died because they don't get enough food. That is because of to much commercial fishing of their food source. That needs to change. Ospreys where taken off the endangered list. But I feel they need to be put back on it. We need to do everything we can to help them.

To who I may concern, I lived in Ocean county, New Jersey all my life. I still do. It's upmost concerning to me to see pictures of juvenile ospreys emaciated due to lack of this fish they need to survive. We need these birds for ecosystem as much as any other animal. When I go to Island beach State Park in New Jersey I always see them. They are beautiful and they are part of my life. I love to watch them every time I'm at the beach. Please do something about this situation. Thank you for giving me some time to speak my grievances. Sincerely, Danielle Baracia

Regarding Atlantic Menhaden,
Please do not increase the fishing of Menhaden. In Connecticut, we've documented an alarming drop in the number off Osprey, the beautiful bird that relies on Menhaden as it's food source. These birds are already struggling to survive the obstacles mankind has put in its path, pollution, climate, competition for breeding spots, predation at nesting sites. A further reduction in food source may make it difficult or impossible to recoup their numbers. This gorgeous bird relies on this food source as it's makes its long journey twice a year to ànd from South America, up the east coast to breeding sites along the Connecticut River and our shores. It is our shared responsibility to care for these birds and steward all resources. Please do not allow for further reduction in this unique birds food source. We have a choice, they do not. Thank you

As a life long recreational striper fisherman with a hope to have this fishery for my grandchildren and my love for all marine animals dependent on the bunker for food I think it is totally absurd that we allow the reckless harvest of said bunker menhaden by any greedy corporations. Please put real limits on this basic marine building block before it's too late. While you are at it eliminate commercial striper fishing completely. No need for it based on the amount of money brought in by recreational fisherman. Thank you for the opportunity to shape this important measure.

The famous menhaden-dependent osprey nest colony in the Ct. R. Estuary, CT, suffered reproductive crash as bad as the DDT era in 2026. The carefully documented nestling starvation is a reliable bioindicator of menhaden failure in this region. It is unprecedented, in a place where menhaden are normally abundant. PLEASE install harvest quotas and TAC reduction to remedy this ecosystem tragedy. This implies scrutiny of Lund Fisheries and reducing their harvest impact on NJ-NY-CT, with quotas.
18 miles away, on Gardiners Bay NY, the famous menhaden-dependent Gardiners Is. osprey colony also suffered extreme nestling starvation and reproductive failure--so this is a REGIONAL ecosystem depletion of normally abundant Atlantic Menhaden--which must be restored through strict harvest quotas.
AND: We need scientific study and inquiry to determine the sources of this extreme menhaden depletion:
Human harvest, natural events, or some combination of the two. PRS 9/16/2026 Old Lyme, CT
Paul Spitzer PhD Cornell 1980 has studied osprey population ecology for 60 years--I have witnessed nothing like this widespread regional osprey starvation caused by menhaden failure in my lifetime.

I have watched for years as this body has betrayed the people of Virginia with the brazen disregard of the health of our beloved bay,as in Chesapeake. I grew up in South Hampton Roads and remember night fishing in the winter with tolling near the bay bridge tunnel. We were very cold but the fishing was too good to miss. Back then the striped bass was so plentiful that you were guaranteed to get a boatload of fish. Those were the days. I wish we could go back to those wonderful cold nights fishing but I have accepted that it would take a lifetime of recovery for a healthy bay. The menhaden are the lifeblood of a healthy bay and we need brave men to protect it from the evil of overfishing by a Canadian company no less. Board members, please show some courage and stop this madness once and forever. The other states have banned this destruction of our natural resource. Please show some respect for our children and grandchildren and vote with your heart and not with your wallet.

There are clear patterns in Osprey decline over the last years. We need to do something now to ensure this species' success. This iconic coastal species is a symbol of resilience on our country's coast. They have bounced back once, and can do it again but they need our support. Reducing the amount of harvestable menhaden is an actionable and meaningful step that will not only support this species but a large array of animals within the coastal food chain.

Please make the necessary restrictions on bunker fishing, now. Once the damage is done, it will be difficult to recover from and the Ospreys in NJ are fading away quickly. We only saw a few last year and only one this year! ONE in an area where many had been seen previously! Shut down menhaden fishing for at least 3-5 years to restore their numbers, so the birds and other marine life reliant on this fish for good can begin to recover. Man's greed is ruining our planet and causing harm to the food chain. Stop the bunker fisheries for the next 5 years. You all caused this travesty, now fix it.

I am an ecologist who worked as the hawk counter for the Cape May Bird Observatory in South Jersey for a number of years. I would always count large numbers of migratory Osprey during the fall, evidence of a robust breeding population that had recovered from the ravages of DDT— an incredible conservation success story. Unfortunately, each year, reports trickled in of poor breeding success in Delaware Bay with overfishing of their main food source (Atlantic Menhaden) seemingly to blame. This year I visited Cape May to see old friends from my time living there and, despite being in the peak migratory window for Osprey, I saw relatively few. Those I did see were predominantly adults. I was shocked by how obvious the decline was, how obvious to failure to reproduce and replace themselves was. Friends I spoke to even told me of seeing juvenile Osprey that were emaciated and starving. Of the few Osprey I saw catch fish, I didn't see a single one carrying a Menhaden. Typically, almost every fish I see caught is a Menhaden (I usually joke to people that I could identify what fish an Osprey was carrying from a mile away because it was almost always a Menhaden).
I was sickened by what I saw this past month. To recover this incredible species only to be on the cusp of losing it again is almost too much to bear.
The catch of Atlantic Menhaden must be lowered. Dramatically. Ospreys that starve are dead forever. If the population is wiped out, they're gone, that's it. No amount of economic gain is worth that.

Thank you for considering a reduction in menhaden fishing for the sake of ospreys. I am hopeful that sustainable fishing practices can be implemented so that the population remains strong, those in the fishing industry can maintain their livelihood, and the osprey population continues to grow. It is very upsetting to see the lack of osprey young surviving due to starvation, and I would like good environmental stewardship to win out so we can continue their comeback.

Respectfully request that the State of Virginia support:
Bay Cap Amount: Sub-Option B4 — a 50% reduction, resulting in a 25,500 mt cap.
· Quota Periods: Option B1 — even-length periods with evenly distributed harvest.
· Underage Provision: Underage Sub-Option 1 — roll Period 1 underages evenly into Periods 2 and 3.
· Revisit Provision: Option B — revisit the Bay Cap every three years.

I support the greatest reduction in menhaden fishing in the Bay and the most frequent review of the allowable catch, to permit further cuts to harvesting menhaden in the Bay. Everything that eats menhaden is suffering a sharp decline in population in the Bay. Why not ask Omega to use just a little more fuel and do their fishing in the ocean for a few years to see what impact that would have on the recreational fishing in Maryland, and Virginia. Fishing in Maryland is currently being decimated and everything reasonable should be tried to help it recover.

The ban of bay menhaden has no basis at all except for agenda driven studies. Agenda driven studies will show whatever outcome the person doing the study wants it too, depending on what parameters it uses for reference. Everyone lobbying against menhaden being harvested has an agenda and will soon figure out history. When something is banned from harvesting it never gets better. The ban of crab dredging did not replenish the blue crab population. The regulation of rock fish did not replenish the rock fish population in the bay. Let's open our eyes to the obvious which is contamination in the bay. Constantly spraying round up and toxins draining into the bay has made the bay a toxic pool of roundup. No fish wants to swim in a toxic pool of roundup. The ocean has wonderful amounts of fish while the toxic bay suffers. Everyone needs to use their brain and see the obvious. Everyone living around the bay plays a role. It's not over harvesting. That is the easy target to blame when people don't want to take responsibility for their actions. Be smart and use your critical thinking skills and don't jump on a bandwagon wagon of morons that have no clue what decade it is.

I own a house on the Chesapeake and have spent time on the bay my entire life (56 years). Never have I seen so few ospreys as this year. The population has crashed, and it is hard not to connect this to overfishing of menhaden. The catch needs to be reduced and more sustainable for all

I am in support of reducing Menhaden fishing in order to benefit the local ecosystem in the Chesapeake, specifically the Osprey population. These birds are heavily reliant on Menhaden for survival. They had their least successful breeding season on record, even including the peak of the DDT crisis in the 1970s (source- center of conservation biology at William & Mary, linked at the end). Ospreys don't understand the concept of finding an entirely new nesting ground once the season ends- they instinctually return to the same nest year after year, even if the food supply is dwindling. Therefore their chicks will simply starve to death. The Ospreys need our help. Please consider reducing commercial Menhaden harvesting before the local population of ospreys dies out. Thank you for considering this matter. Sincerely yours, Rachel Gambino

Our fishing industry/recreational fishery has been progressively getting worse year after year we fish from Raritan bay to barnegat lighthouse where wonce was an abundance of bunker around this year fishing all species from striped bass tuna fluke etc has been poor we need to cut quotas and bring back the big schools of bunker before all is lost for years to come

I am 70 years old, and have been fishing the Chesapeake Bay all my life. I have never seen fewer crabs, baitfish, especially Menhaden, with my experience I would guess from what I see it's been well over 50%. I actually say 70% less. If we regulate the fishery and change the over harvest stop the other harvest hopefully it's not too late but many times we wait till it is too late, the Chesapeake Bay is a amazing place and must be protected,
I personally have been on the water, and saw the destruction these men menhaden boats are doing I have seen not only dead red fish but even see turtles, and once a bottlenose dolphin dead floating on the surface after the boats have left,
Let's face it they don't care if they killed the last one but once they're all gone, that's it forever. Please don't wait for it to be too late.

I am writing to urge you to protect the menhaden by reducing the harvest in the Chesapeake Bay. Menhaden are a foundational species, important to other fish and birds. As a birder I have witnessed first hand the decline of ospreys in recent years. As an indicator species, their decline illustrates the risk to the bay ecosystem by the overharvesting of menhaden. Thank you for your consideration.

I volunteer with the Coastal Research and Education Society of Long Island and I strongly encourage stricter fishing laws regarding bunker, because they are one of two main food sources for the whales that we study here each summer. This year we have identified 16 new mom and calf pairs, all of whom will return to this “neighborhood” next year looking to feed, and it’s important they have enough to sustain their young.

Hello,

The fishing in the Western Long Island Sound has been heavily affected by this netting of fish. My family and I have been fishing these waters for 30 years. Never seen fishing so terrible as now. This has to stop. Plain and simple if they keep taking the baitfish the game fish will no longer come.

Thank you
Christopher Vena

Hello Atlantic States Marine Fishery Commission!
Thank you for reviewing my comment.
Please cut the menhaden harvest by 50% immediately! Keeping the current harvest rate is unsustainable for industry and wildlife. The current rate of catch is reckless and endangering the long-term health of the fishery. We need limits to protect the fishery as a resource for humans AND... to keep other wildlife such as whales and osprey from disappearing.
This continued overharvest harms the planet and our children and grandchildren and great grandchildren... those who will inherit our blessings or our mistakes. You have a fork in the road now... that you can turn into a blessing...
Thank you,
Rochelle Cornell

Comment

My name is Rebecca Salen, and I grew up boating on the Maryland portion of the Chesapeake Bay. As a child, I remember the joy and sheer awe of being so close to the wildlife living in the bay. One of the most memorable species for me was the osprey. I remember there being so many ospreys, it seemed like everywhere you looked you could find one hunting for fish, or raising its young in one of the many nests on the channel markers. These nests were rarely empty during breeding season. You could hear the sounds of the ospreys hunting, communicating to their mates, and the sounds of their young begging to be fed. I took being able to watch these incredible creatures for granted, assuming that they would always be there.

This year, when I went out on the bay, these nests were empty. Quiet. A scenario described in Rachel Carlson's "Silent Spring," a required reading in my college ecology class.

I remembered reading in 2025 that there would be an increase in the amount of menhaden allowed to be fished out of the Chesapeake Bay. This lack of regulation has led to a drastic decrease in the already small amount of menhaden living in the Chesapeake Bay. Menhaden are a crucial species for ospreys. High in fatty acids and proteins, they are perfect for growing chicks. According to a study done by Center for Conservation Biology, 2026 was the worst year on record for osprey breeding

performance, with many of the young starving to death. The ospreys were unable to feed their young menhaden because there was no menhaden for them to catch. They had already been fished up by companies like Omega Proteins and Ocean Harvesters, who use the menhaden for omega-3 pills, pet food, and salmon farms. The consequences of these disastrous, industry-influenced decisions on menhaden fishing quotas are deadly.

It is past time for us to put environmental concerns above these corporations' constant greed and hunger for profit. We have to make these decisions based off of true scientific data, not data poisoned by the greed of the fishing industry. Stop overfishing menhaden, especially for a foreign company's profit. Like what was seen with DDT in the 1970's, the osprey population was able to bounce back once we stopped spraying DDT. Let the menhaden bounce back and flourish without overfishing, and we will see a return of the osprey population as a result. In an ideal world where we actually cared about the wonders of the nature around us, we would not allow for companies like Omega Proteins to harvest nearly 70% of the Chesapeake Bay's menhaden population (110 million pounds of menhaden) for the purpose of money. Since we do not live in a perfect world, the next best thing is to prevent these companies from fishing so many of the menhaden from the Chesapeake Bay. Regulate them, lower the amount of this keystone species that they are allowed to remove from the ecosystem. Make sure that the limit allows for a resurgence in not only the population of ospreys, but for the striped bass as well. And, most importantly, once the menhaden population recovers, do not allow for these companies to overfish them again.

We have failed to learn from the environmental mistakes of the past. Let's learn from those mistakes now. Reduce the cap by 50%. Protect this keystone species and save the ospreys and striped bass as well. Protect them for our environment and for our future. What kind of world are we letting the next generation inherit? A world where there are no ospreys, no striped bass, no menhaden, and a silent summer. I know I will never take seeing an osprey for granted ever again.

Comment

As a lifelong angler in my mid-30s, I have had the pleasure of surf fishing from every state on the east coast. Our fisheries are some of the most diverse in the world, and serve as an amazing recreational resource for all residents of this country. While the target species vary significantly between Maine and Florida, one of the few consistent actors is everyone's favorite baitfish, the bunker.

Growing up in Massachusetts in the 90s and 2000s, the years where peanut bunker were present always led to the best summer and fall runs for striped bass, bluefish, bonito, and false albacore. However, we went entire seasons without ever seeing peanuts and the impact was palpable. Adult pogies at that time were the stuff of legend, existing only in the minds of those old timers who witnessed epic blitzes back in the 70s.

During the late 2000s and into the early 2010s, adult bunker made a strong comeback which led to the best northeast fishing I ever experienced. Over the past decade we have watched the bunker stocks dwindle, and the impact to our fisheries has been visible again. Now as a resident of New Jersey, we rely heavily on the southward migration of peanut and adult bunkers to fuel the entire spring and fall runs.

I have friends who are commercial fishermen, and can sympathize with those who think any regulation is hurting the bottom line of an industry already struggling. However the importance of bunker goes far beyond their dollar value per pound.

Menhaden filter our estuaries and help to lessen the impact of runoff and pollution that close our shellfisheries. Menhaden serve as the bedrock of an ecosystem that supports marine wildlife in the water, on land, and flying above our heads. Menhaden are the reason that many patrons travel to coastal towns each year and spend their dollars supporting local tackle shops, restaurants, hotels, and countless other businesses.

Put simply, Menhaden are worth more to our economy in the water than in nets, both in the Chesapeake and up and down the Atlantic Coast.

It is with these sentiments that I respectfully urge the Atlantic Menhaden Management Board to adopt the following options in Draft Addendum II:

Section 3.1 – Sub Option B4: Reduce the Chesapeake Bay Reduction Fishery Cap by 50%, establishing a Bay Cap of 25,500 metric tons. I support the maximum proposed reduction as a precautionary measure to increase the availability of menhaden within Chesapeake Bay and better support the fish, wildlife, and fisheries that depend upon this critical forage species.

Section 3.2.1 – Option B1: Establish Even Length & Even Harvest quota periods. Spreading reduction harvest more evenly throughout the season will help prevent excessive concentration of harvest during any single portion of the year and provide greater opportunity for menhaden to remain available throughout the Bay.

Section 3.2.2 – Underage Sub Option 1: Any underage from Quota Period 1 should be split evenly and rolled over into Quota Periods 2 and 3. This approach preserves access to unused quota while preventing that harvest from becoming concentrated entirely within the next quota period.

Section 3.3 – Option B: Require the Chesapeake Bay Cap to be reviewed at least once every three years. Regular review will allow management measures to respond to updated science, fishery conditions, and the ecological needs of Chesapeake Bay.

Taken together, these options provide a reasonable and precautionary approach that recognizes menhaden's importance not only as a harvested species, but also as a foundational forage fish supporting the broader Chesapeake Bay and Atlantic coastal ecosystem. I respectfully ask the Board to adopt these measures in the final Addendum II.

For the past four years, I've been monitoring osprey nests as a volunteer for the CT Audubon 'Osprey Nation' Program. Of the nests I've monitored over the previous years, there have consistently been 1-2 fledglings per nest at the end of the season. This past year I monitored four nests, all located on or adjacent to where I live on Johnsons Point in Branford, CT. Nine confirmed eggs (two in three nests; three in one nest) produced only two fledglings this year. There was a post-hatch failure of both nestlings in the other two nests. While the remaining nests did produce one fledgling each, those same nests had two nestlings each. It was quite painful to watch the stronger of the two nestlings being fed by an adult with the other nestling from both those nests perishing soon after. My proximity to the end of Branford Harbor also allowed me to observe osprey flying in and out with food. This year, osprey took longer to find fish and about 75% of the osprey observed came in with smaller fish than previous years. Between the human activity that occurs around some of these nests, and the more extreme weather, these wonderful birds don't need the added stress of finding fish, their only food source! Therefore, I am in favor of reducing the Chesapeake Bay reduction fishery cap by up to 50%, and creating quota periods to distribute harvest more evenly throughout the fishing season.

I do not support the cuts. The most recent survey concluded the fishery was not overfished. Making a huge negative financial impact on hard working Americans is not a solution to the problem that the average person has negative feelings because biased orgs tell them they should. The fishery does provide benefit to us.. feeding farm raised fish..fertilizer to grow crops and many other valid and important benefits. No cuts are justifiable at this time.

The bay is overfished!! The menhaden are overfished and causing great harm to the ecosystem, in particular for the osprey whose numbers are in sharp decline in the Chesapeake Bay. Our Chesapeake Bay ospreys are in significant reproductive decline and ornithologists have connected that to lack of menhaden in the Chesapeake Bay. Virginia is the only Atlantic coast state that allows industrial-scale trawling for menhaden. You must stop overfishing and restrict fishing activities.

Atlantic Menhaden should be managed for abundance as a bait fishery (not a reduction fishery) to benefit ALL states and stakeholders along the Atlantic Coast. The primary nursery of this species, The Chesapeake Bay, should be managed accordingly.

Thank you for your efforts to sustainably manage our shared resources. I write in support of the Draft Amendment to reduce the Bay Cap by 20-50% (3.1 option C1 c,d,e) with quota periods (3.2.1 B2) and with revisiting the cap limits at least every three years. Osprey poulations in the northeast support fledglings with a diet of menhaden. Dramatic reductions in osprey chick survival in MD, CT, etc. in 2025 and 2026 may indicate a reduction in available mehaden - years in which we do not have actionable non-fishery counts. As noted in the report and in NOAA's 2025 Atlantic Menhaden Stock assessment, the trawl and other fishery independent data sources on Mehaden abundance are 2-3 years old (e.g. NOAA's 2025 report only contains data through 2023). While more data is clearly needed, I believe the uncertainty around true abudance at the current time supports cautious reduction of cap limits.

FMP Coordinator James Boyle and Members of the Commission,I am writing as a concerned Virginia resident to express my strong, unequivocal support for Draft Addendum II and to urge the Commission to implement the strictest possible protections for Atlantic menhaden, particularly within the Chesapeake Bay.Menhaden are the ecological foundation of our coastal ecosystem. Decades of intensive industrial reduction fishing have disrupted the local food web, leading to devastating impacts on wildlife that depend on them. We are currently witnessing an ecological crisis with our local osprey populations, where nesting success has plummeted due to a severe lack of food. Osprey chicks are quite literally starving in their nests because industrial purse seines are clearing out the localized menhaden biomass before these birds can forage.To allow the menhaden population to fully restore and to protect critical predators like the osprey, I strongly urge the ASMFC to adopt the following measures:Implement a 50% reduction in the Chesapeake Bay reduction fishery harvest cap immediately.Establish strict seasonal closures during peak osprey nesting and migration seasons to prevent localized depletion.Prioritize ecosystem-based management that factors the nutritional needs of marine mammals, seabirds, and predatory fish into harvest quotas, rather than managing menhaden solely as a single-species commodity.We cannot afford to wait for decades of further study while our osprey populations collapse. Please take decisive action to restrict industrial overharvesting and restore the balance of the Chesapeake Bay.Thank you for your time and your dedication to protecting our shared marine resources.Sincerely, Mary Jane Hall Norfolk VA

To whom it may concern:

I am commenting to urge the commission to reduce the fishery cap by 50 percent to help ensure enough menhaden remain available for ospreys and other wildlife, helping to conserve and grow the ecosystem.

There is growing concern that osprey populations along the Eastern seaboard are declining due to lack of food. Last year, Connecticut Audubon Society's Osprey Nation recorded its lowest breeding success since the statewide community science program launched in 2014 to monitor these birds.

By 8/1/2025, out of 706 nests with up-to-date reports, 113 had failed - about 1 in 6. In the same timeframe in 2026, of 691 nests with up-to-date reports, 171 have failed - roughly 1 in 4.

The decline at Old Lyme's Great Island, once a former osprey stronghold, has been particularly severe. 37 osprey chicks fledged there in 2024; in 2025 this number decreased to 27, and in 2026 only 5.

Because ospreys feed almost exclusively on fish, the Osprey Nation community science program serves as an early-warning system for the health of Connecticut's waters and the abundance of prey species like Atlantic menhaden.

I thank you for considering my suggestion to reduce the Chesapeake Bay menhaden fishery cap by 50%. Such a decision will have longterm positive impact for osprey populations and help foster a burgeoning ecosystem to be enjoyed by future generations in perpetuity.

Thank you for your time.

I have fished the entire length of the Chesapeake bay and it's tributaries for the last 40 years and have seen many positive changes throughout that time. One consistent area that has been lacking however is the continually diminishing amount of boat present throughout the middle and upper bay. Fishing has certainty been affected and has led to the loss of a vast number of jobs. The charter fleet is a fraction of what it was, tackle and bait shops have closed, hotels/motels have closed, and many small businesses related to fishing are in decline. This is a way of life for those around the Chesapeake and it may never be recovered. If the youth cannot experience the bay and understand all that it can offer, why protect it? All of this because of a special interest group touting a relatively small number of jobs that are supported by the reduction fishery. Please stop this cornerstone species from being depleted for the needs of a few and to the detriment of countless people and animals.

I support the Draft Addendum II and conservation-minded reforms that better protect menhaden and support a healthy Chesapeake Bay ecosystem, including reducing the Bay Cap by 50 percent in 2027 and implementing quota periods to more effectively distribute reduction fishing pressure throughout the season.

As a Severn River resident, it has been a great joy to watch osprey fledge in early Summer - we have been watching for 4 years. This is the first year that two young osprey died in the nest. Action is needed.

As a life long Maryland resident and a recreational fishing enthusiast for some 50 + years, I haven't felt more strong about anything in regards to the foolishness of the authorities at both state and federal levels to continue to allow a commercial company to continue fishing inside the Chesapeake Bay waters for Menhaden. It's proven that the Menhaden fish are abundant in the Atlantic Ocean and commercial fishing on this scale should be ONLY allowed in the Atlantic waters. Each year I see the Rockfish problems and in recent years I have watched the Osprey's not having food for their young. In areas like the Kent Narrows, and waters around Kent Island the nests are empty where a few years ago each nest had a healthy pair of parents feeding Menhaden to their young. It's sad that these problems have continued while a commercial company continues to deplete this vital food source for Rockfish and Osprey. The bycatch alone in the Omega companies massive nets inside Chesapeake Bay waters is disgusting and should be ended or reduced greatly.

I urge the Atlantic Menhaden Management Board to take strong, precautionary action to reduce the Chesapeake Bay reduction fishery cap and address the ecological impacts of concentrated harvest.
Atlantic menhaden are a critical forage fish and an essential part of the Chesapeake Bay food web. They provide food for striped bass, bluefish, weakfish, ospreys, and numerous other predators. The health of these species and the broader Bay ecosystem depends on maintaining an abundant supply of menhaden in the water.
The Chesapeake Bay cap was originally established as a precautionary measure in response to concerns about localized depletion. Since then, managers have repeatedly recognized the need for stronger protections. The cap was reduced from 109,020 metric tons to 87,216 metric tons in 2012 and ultimately to 51,000 metric tons in 2018, in recognition of the Bay's importance as nursery habitat and the need to better reflect contemporary fishing levels.
The Board's Draft Addendum II is an important opportunity to continue that progress. I support reducing the Chesapeake Bay cap by up to 50 percent and establishing quota periods that prevent excessive concentrations of harvest early in the fishing season.
However, the Board should view these measures as a minimum step toward addressing the problem—not as the final goal. Management decisions should prioritize ecosystem health, predator needs, and the long-term abundance of menhaden rather than simply maximizing allowable harvest.

The Chesapeake Bay is a shared public resource. Its forage fish should be managed accordingly. When there is a reasonable risk that concentrated fishing could reduce the availability of menhaden to predators or negatively affect the broader ecosystem, managers should act conservatively.
I urge the Board to adopt the strongest available reduction in the Bay cap, establish effective seasonal quota periods, and continue moving toward management that prevents overfishing and protects menhaden as a critical foundation of the Chesapeake Bay ecosystem.
Thank you for considering these comments.

Please support the complete closure of the Menhaden fishery until proper studies are done to determine the actual sustainable level of fishing in the Atlantic. Currently we are seeing up to 1/3 of ospreys avoid nesting in the lower Chesapeake as well as chicks starving to death as their main source of food is disappearing due to overharvesting. This is only one facet of who is being affected by this ecological disaster - menhaden are a keystone species and support the multi-million dollar sport fishing industry as well as being used for bait by blue crab fishermen. If full closure is not an option, at least reduce the take to a more reasonable 50% while we still have a chance to save this important species population from collapse. Thank you.

No foreign owned company should be allowed to fish the United States waters and deplete our resources for their monetary gain. I have fished the Chesapeake Bay all my life and I'm 63 years of age. Menhaden are the primary forage fish for many of the wildlife in the bay.I caught Striped bass that we're full of little blue crabs because the Menhaden were not plentiful. I believe the sores on the strippers that are caught at times come from the lack of oils the Menhaden have is lacking from their diet. As much money as the Bay states spent trying to get Stripped Bass back from collapse I would think the governing stares would do everything in their power to protect the resources. I believe I read the Chesapeake is one of the largest nurseries for baby Menhaden on the east coast.No Menhaden should be taken from it.Moe baitfisj equals more game fish. More game fish equals more revenue from fisherman at local stores and quides.I would think the States would make more revenue from tourism and money spent on tackle,licenses, and fuel than they get from taxes and revenue from ene foreign owned company. Stop all Menhaden fishing in the Chesapeake Bay. Make them stay in the ocean away from the mouth off the Bay

I am writing to urge the Commission to take action to reduce the catch of Menhaden along the eastern coast of the United States. As a Member of the State Board of the Connecticut Audubon Society and as Chair of it's regional center in Old Lyme Connecticut, I have grave concerns about the documented failure of Osprey nests in our state … and, particularly, on the southeastern coast. As the Commission is aware, it was in Old Lyme where decades ago the renowned writer, and artist, Roger Tory Peterson, was instrumental in verifying that a decline of Osprey in the 60's and 70's was due to the use of DDT and resulted in a failure of Osprey eggs. Today's concern is most seriously manifest in the Chesapeake Bay region but is now also being verified in our waters. Menhaden is a keystone species that, in this region, almost exclusively supports Osprey and their chicks are dying from starvation. They are abandoning their nests and reproducing at a rate insufficient to maintain their population. The Commission has it within its authority to reduce the catch of the commercial fishing industry in order to allow the Menhaden population to recover and preserve an iconic bird.
Sincerely,
Claudia Weicker,
Chair, The Connecticut Audubon Society's Roger Tory Peterson Estuary Center
100 Lyme Street, Old Lyme, Connecticut 06371

I'm a recreational fisherman who fishes the mouth of the Connecticut River in the early Spring and late Fall and mainly in Fishers Island Sound in the summer. My friend Ray and I have been fishing almost every week for bluefish and striped bass from 1992 to the present. Our fishing (i.e. catching) has been declining for at least the last 10 years. The last few years have been the worst we've ever experienced. So far in 2026 we each caught only one striper. Also we have not seen any menhaden and very few gulls and terns.
Please do all you can to reduce the menhaden catch so the striper and blue population can recover.
Thank you,
Reed cass

The Atlantic menhaden is crucial food for bird species including loons, eagles and especially osprey. Ospreys are currently starving because their major food source is being taken by omega Three. This is not a sustainable practice for Omega Three and other fisherman. Harvesting quotas need to be established ASAP before the menhaden are gone.

There are always choices to be made on resource allocation. This one is easy, there is more need to limit the allocation of fish protein to industrial uses than there is to allocaate it towards sustaining the food chain for ocean environments. Reduce the uses of this resource for fertilizers and farm feed and increase it for growth of fish stock and ocean environmental balance.

September 11, 2026

Virginia Marine Resources Commission
380 Fenwick Road, Bldg. 96
Fort Monroe, VA 23651

Re: Public Comment in Support of the Proposed 50% Reduction to the Chesapeake Bay Menhaden Reduction Fishery Cap (ASMFC Addendum II)

I strongly support the proposed 50% reduction to the Chesapeake Bay reduction fishery harvest cap, including distributing the allowable catch more evenly throughout the fishing season. This measure is consistent with the ASMFC Plan Development Team's own April 2026 draft recommendations and is supported by 92% of Virginia voters, according to a 2026 poll conducted by New Bridge Strategy and FM3 Research.

While I believe a broader review of purse seine netting in Virginia waters is warranted in the future, my primary request today

is focused on the 50% cap reduction currently under consideration.

The ecological evidence for this reduction is compelling. The 2025 ASMFC stock assessment update revealed a 37% decline in menhaden biomass compared to previous models. Virginia's own reported menhaden bait harvest collapsed from 5.4 million pounds in 2019 to less than 1 million pounds in 2024, according to VMRC data. The consequences are visible throughout the food web: striped bass, cobia, bluefish, whales, dolphins, pelicans, and osprey all depend on menhaden as a primary food source. In the lower Chesapeake Bay, menhaden depletion is already causing measurable population-level harm to these species.

The data supporting this action is robust. A 2024 peer-reviewed study by Dr. Bryan Watts at the Center for Conservation Biology documented that only 17 of 167 monitored osprey nests in high-salinity areas of the lower Chesapeake Bay were successful, producing just 21 surviving chicks. The researchers directly linked this unprecedented reproductive failure to menhaden depletion. A subsequent 2025 study confirmed the crisis worsened Bay-wide. These findings, combined with the ASMFC's own stock assessment showing a 37% biomass decline, led the Plan Development Team to recommend the 50% cap reduction now before you.

Industry representatives continue to cite wildlife recovery data from the 1960s through 1990s, attributing population gains to the DDT ban. These references are misleading in our current context: osprey populations recovered decades ago and are now declining again specifically due to food scarcity, not pesticide exposure.

I am sympathetic to concerns about economic impact in Reedville. However, the facts are instructive: when the coast-wide quota was cut 20% for 2026, industry sources confirmed zero layoffs and no reduction in the working fleet (still six fishing boats and two run boats). A 50% Bay cap reduction is manageable. Moreover, Virginia hosts the last industrial reduction fishery on the Atlantic coast, operated by a single company (Omega Protein) owned by Canadian-based Cooke Inc. The economic benefits of this operation are concentrated in one foreign-owned firm, while the ecological and economic costs are distributed across all Virginians.

The broader economic picture favors conservation. In Virginia Beach alone, continued menhaden depletion threatens:

- Commercial fishermen's livelihoods and the restaurants they supply
- Whale and dolphin observation cruises that depend on healthy prey populations
- Recreational fishing charters and tourism
- Restaurant, hotel, and retail revenue tied to coastal tourism

These sectors represent hundreds, if not thousands, of jobs in our community alone.

The 50% cap reduction is a precautionary management measure grounded in the best available science. Even those who dispute individual studies cannot argue against the prudence of protecting our most valuable ecological resource while research continues. The cost of inaction, should the biomass decline prove as severe as current models indicate, would be irreversible.

I urge the Commission to approve the 50% reduction to the Bay cap. Thank you for your consideration of this comment.

Chrysta Donatelli
228 50th St
Virginia Beach, VA 23451

The Honorable Frank Pallone
I am writing to you as a concerned environmentalist and avid fisherman. I have fished the waters off Maryland to New York for the past 50 years. I have seen both great and awful fishing over those years. Omega Protein has been harvesting beyond excessive amounts of Menhaden and the results to our fisheries has been staggering. To date this year I haven't seen 1 bunker pod either in the Raritan bay or the ocean and I have fished over 50 days this season so far. Something needs to be done to limit their take of Menhaden and the bycatch which destroys all species of marine life.
Sincerely
Steve Roberts MSPT

The ecosystem of the entire Chesapeake Bay and its tributaries is suffering the loss of the crucial menhaden supply that supports it. Fish, birds, crabs, and sea floor are all impacted by the damage that the reduction fishery is causing. Commercial and recreational fishermen as well as the tackle shops, bait stores, tourism, and even land owners are impacted by the damage to the menhaden nursery that is the Chesapeake region. Please move the menhaden fishery entirely offshore, like the other eastern states have done to preserve the menhaden in the Chesapeake. Current damages will take decades to reverse.

Thank you for the opportunity to comment.

I strongly support eliminating the Atlantic menhaden reduction fishery from the Chesapeake Bay. A 50% reduction is a step in the right direction and I support this move wholeheartedly, but it is not enough.

The Chesapeake Bay is not just another body of water along the Atlantic Coast. It is the largest estuary in the United States, a critical nursery for countless marine species, and one of the most important ecosystems on the East Coast. Menhaden are at the center of that ecosystem. They are the primary forage base for striped bass, bluefish, weakfish, ospreys, bald eagles, dolphins, and many other species that depend on the Bay.

For decades, Virginia's reduction fishery has been allowed to harvest enormous quantities of menhaden directly from Chesapeake Bay waters and exceed quotas without meaningful repercussions or penalties. While managers may point to coastwide stock assessments showing that Atlantic menhaden are not overfished, those assessments do not answer the most important question: Are there enough menhaden left in the Chesapeake Bay to support the Bay's predators and ecological functions?

The Chesapeake Bay should not be treated as a feedstock source for industrial fishmeal and fish oil production. It should be managed as a living ecosystem.

Evidence of declining osprey productivity in portions of the Bay, concerns about localized depletion, conflicts with bait fishermen, and increasing public concern all point to the same conclusion: more menhaden need to stay in the Bay.

The economic value of menhaden left in the water far exceeds their value once reduced into industrial products. Healthy menhaden populations support recreational fishing, charter captains, tackle shops, tourism, birdwatching, and a thriving Chesapeake Bay economy. Every striped bass caught by an angler, every osprey nesting successfully along the shoreline, and every dolphin sighting enjoyed by visitors depends on a healthy forage base.

The Chesapeake Bay has undergone decades of restoration efforts costing billions of dollars and involving federal, state, and local partners. We work tirelessly to restore habitat, improve water quality, rebuild oyster populations, and recover underwater grasses. It makes little sense to simultaneously allow industrial harvest of one of the Bay's most important forage species.

This issue comes down to priorities.

Do we manage the Chesapeake Bay primarily for a single industrial reduction company, or do we manage it for the health of the entire ecosystem and the millions of people who depend on it?

I believe the answer is clear.

The Commission should eliminate the reduction fishery from Chesapeake Bay waters and manage menhaden first and foremost as the foundation species they are.

Leave the fish in the Bay. Let them feed striped bass. Let them feed ospreys. Let them support the recovery of the Chesapeake ecosystem. I have been fishing the bay for 30 years and have seen with my own eyes the decline in forage fish and specifically the size of menhaden has significantly declined, which should be a warning to everyone.

Thank you for your consideration.

I have been watching the Osprey population for the last decade. My husband has helped install 3 Osprey cams, 2 in CT and one in RI. I regularly post on social media sites information about nest happenings. We have seen many tragedies on the nests including entanglements with fishing line and suicide. This year has been the worst as we all have watched osprey starve to death, calling to parents for food that does not arrive. These are experienced birds and early in the season when herring was running they brought plenty of food into the nest. When it was time to rely on the menhaden, the food dried up. We also are involved in raptor rescue for A Place Called Hope. The birds we went to pick up were completely emaciated, crops sunken and the birds were featherweights with no fight left them. Most didn't survive. It was a horrible season. Some nests lost 2 out of 3 birds. Other nests we monitor were abandoned, parents left the chicks something we've never seen. My husband has put up over 200 platforms in CT and he maintains contact with many of those landowners on the coast. The reports are grim, dead chicks everywhere.
The time to put a pause on the excessive menhaden taking is now. The industry has proven it cannot regulate itself. The osprey are not the only ones pointing to the problem, once again they are the indicator species showing the effects. If you cannot completely stop the overharvesting, at a minimum drastically curtail it. The time to act is now, pause it until you get further proof of you need that but observations and reports by many should be sufficient.

Thank you
Lorrie and Terry Shaw

It is absolutely necessary establish controls on menhaden harvesting in the US coast and Chesapeake Bay. Companies, especially foreign companies with no stake in the US and states' economies, should not be allowed to vacuum these fish from our waters with no regard to the crushing ecological, recreational, and economic consequences. Our fish and wildlife are suffering documented negative impacts from the dwindling numbers of this important link in the food chain. It is not only devastating to them, but also to everyone who depends on healthy coastal ecosystems—residents, fishers, boaters, tourism, and more. Limit menhaden harvesting before it's too late.

You are failing to properly regulate the harvesting of the Menhaden along the eastern seaboard. I am an active scuba diver, and spend multiple days throughout the spring ,summer, and fall offshore in the New York ,New Jersey waters
. I have never seen such low levels of Menhaden as this past year. In addition, our organization ,theJamaica Bay Ecowatcher's have been monitoring the osprey population in Jamaica Bay for multiple years .this year we had 22 nesting pairs of osprey yet only five surviving chicks were noted in our Survey, which we believe is a direct correlation with the lack of their key food species Menhaden
action needs to be taken now to reduce the allowable take of Menhaden by the reduction industry.

My understanding is that Virginia still allows purse seine fishing, plane spotting and vacuuming up of menhaden which results in overfishing of menhaden. This type of fishing has been prohibited in other states and should be prohibited in Virginia as well. Efforts to launch research on menhaden fishing and its effects on the food chain (and Osprey breeding) has also failed in Virginia and should be supported.

Has Virginia considered suspending Omegas operation until a study of the impact removing hundreds of millions of pounds of menhaden has been done? This study was purposefully not done so that this practice could continue.
Like all the other states on the east coast, Virginia needs to adopt the 3 miles off shore stance that every other state has in place to preserve this nursery.

I strongly oppose industrial menhaden fishing in the Chesapeake Bay and Virginia's rivers, and I believe it is long past time for Virginia to put the health of the Chesapeake Bay ahead of the interests of Omega Protein.

Menhaden are not simply another fish to be harvested. They are a critical forage species and an essential part of the Chesapeake Bay food web. Striped bass, bluefish, cobia, osprey, dolphins, and numerous other species depend on this resource. Allowing an industrial reduction fishery to remove enormous quantities of menhaden from the Chesapeake Bay year after year is, in my opinion, fundamentally inconsistent with responsible management of this extraordinary natural resource.

Those of us who have spent years on the Chesapeake Bay and Virginia's rivers have witnessed the changes firsthand. Fishing and wildlife have suffered tremendously. At the same time, Omega Protein continues to operate large-scale vessels and nets in waters that belong to all Virginians, removing a vital forage fish by the millions for reduction into fish meal and oil.

Enough is enough.

The Chesapeake Bay should not be treated as an industrial harvesting ground for the benefit of one company. Its menhaden population supports an entire ecosystem as well as Virginia's recreational fishing, boating, tourism, and coastal communities. The value of these fish swimming in the Chesapeake Bay and supporting that ecosystem must be recognized—not simply the value that can be obtained by catching and processing them.

I strongly support ending the industrial reduction harvest of menhaden within the Chesapeake Bay and Virginia's tidal rivers. If Omega Protein wishes to pursue menhaden offshore, that is a separate discussion. But the Chesapeake Bay and its tributaries should be protected as a nursery, feeding ground, and recreational resource.

Virginia has an obligation to protect the Chesapeake Bay for its citizens and for future generations. We should not wait until additional damage has occurred before taking meaningful action.

Keep the industrial menhaden reduction fishery out of the Chesapeake Bay and Virginia's rivers. Protect the forage base. Protect our fisheries. Protect our wildlife. And protect the Chesapeake Bay.

I have lived in DC, North Carolina and Virginia, and in my life have watched the Menhaden Fleet increase in size to an unsustainable level and begin it''s inevitable decline. In the interest of both the survival of the food web of the Chesapeake Bay on which so much more of our regions economy depends, as well as the marine life, I strongly urge that the Fisheries Commission adopt Addendum II, effective immediately. There is no need to destroy the economic future of the Chesapeake Bay for one industry alone. Respectfully submitted, Anne Rowley (B.S. marine biology, Duke University, M.S. Scientific Communication, University of CA, Santa Cruz)

I live on the Corrotoman River in Lancaster Va very close to the bay. I am very disturbed by the damage Omega protein is doing to the ecology of the bay specifically as it relates to their over harvesting of Menhaden. I am a fisherman and spend alot of time on the water. I also am a biologist and pay close attention to the habitat and how the different species rely on different factors to survive. On my creek there used to be two nesting pairs of osprey. The last two years they have completely left. I have also been down at the mouth of the bay when the ships come in and siphon off all of the menhaden for miles. There was a time where we had bait balls spanning the size of football fields in the bay and the ships come in and the next day you cannot find any menhaden or any other fish for that matter for 50 square miles. The fact that this has been completely ignored for years by the state is outrageous. This over-harvesting of menhaden has to stop before we get to a point of no return.

I am writing in support of limiting commercial fishing of menhaden in the Chesapeake Bay. It has been exceedingly difficult to hear of the starvation of Osprey chicks due to lack of menhaden. We must learn to share our resources, especially with those who were here long before our disruptive arrival. The Bay will cease to be the Bay as we know it if we dont protect these fish, who anchor so much life along the Atlantic coast. Sincerely, Joanne Kresic

My grandson, Capt. Jon Henry Wehner, is a charter boat captain out of Cape Charles, Va. He is 25 years old, a graduate of JMU and was born on the Eastern Shore. He has described to me, and in his online posts, the devastation caused by the Canadian ships which haul in tons of schools of Menhaden which negatively impact fishing, but more importantly are affecting the population of shore birds and game fish which feed on Menhaden. I have flown over the Chesapeake Bay and seen the Canadian ships with massive nets pull in whole schools of Menhaden to be made into dogfood. Regulations need to be made which allow recovery of those species which are being decimated.

Menhaden are a keystone forage species in the Bay, and the evidence of ecological strain is mounting. Osprey nests around the Bay have shown sharply reduced reproduction, with empty nests and starving chicks documented where the birds depend on menhaden to feed their young. Maryland bait fishers have reported steep declines in their own menhaden catches, and many suspect the industrial purse-seine fleet is intercepting fish before they migrate further up the Bay. Striped bass, another major predator of menhaden, have also been cited by anglers and scientists as showing signs of nutritional stress tied to reduced forage availability.

For 150 years this fishery has operated in the Bay with minimal Bay-specific research, relying instead on coastwide stock assessments that may mask localized depletion. Repeated legislative efforts to fund independent research through the Virginia Institute of Marine Science have stalled, and I believe industry lobbying has played a role in that delay. A fishery of this scale and ecological importance should not continue to operate without conclusive, Bay-specific science confirming it is sustainable.

I ask the Board to adopt more conservative harvest caps within the Bay, distribute the quota more evenly across the season (particularly protecting the summer months when ospreys are feeding chicks), and make continued access to the Bay contingent on completion of independent research.

Thank you for considering these concerns.

A reduction of 50% of the catch is better than no reduction at all. Would be better to shut the Omega ships down all together but doesn't look like VA wants to do that —-really doesn't seem like VA representatives care much about what happens to the bay A 50% reduction is better than nothing. The osprey are starving, the fish migrations have been less…this is what happens when there is no food for them in the bay. Omega is ruining the ecosystem of the bay. Please do the right thing and reduce the quota. Thank you

I am a lifelong resident of CT and have always lived within a few miles of our beautiful and precious Long Island Sound. I am devastated with what I have seen happening in just the past 2 years. My husband and I are boaters and frequently fish in LIS, seeing the Ospreys thrive in these waters has been amazing but I am SCARED!!! The Osprey population will be decimated soon if we don't take dramatic action to stop the overfishing of menhaden, commonly referred to as bunker. We first noticed the bunker weren't around last year. When we did see them they sporadic, whereas in previous years you would see schools of bunker in the hundreds, if not thousands. This year it is even worse. It was a common site to see Osprey diving down into the water and rewarded with a bunker, now, I see them flying and circling with nothing in their clutches. Diving down and coming up empty. What are we doing? We pride ourselves in saying that the sound is cleaner than ever before but we are killing our precious wildlife, potentially making LIS a body of water that is a desert. Unregulated Menhaden fishing MUST be stopped. Menhaden is a keystone species, whithout them we not only loose Ospreys but countless other species of fish, birds and wildlife will disappear. Let's do something Now before it is too late.

Please consider reducing the fishing cap on menhaden as proposed by the draft. I'm concerned that Osprey, which are dependent on menhaden are pushed to drastic losses and potential extinction. Breeding successes of Ospreys have been studied for several years and researches have found that the decrease in menhaden have caused drastic and widespread reproduction failures. The Osprey depend on the menhaden for survival for themselves and for their chicks. Researchers have studied Osprey pairs along the Patuxent and Potomac Rivers, and the decrease in menhaden have caused food shortages to adults and chicks that have succumbed to starvation. Chicks are dying after being hatched. Studies show that limited menhaden availability was a major factor in poor production. Osprey were once pushed toward extinction by the pesticide DDT due to eggshells becoming too thin for successful hatching. Conservation efforts and the elimination of DDT have caused Osprey to rebound, but this new threat of starvation from menhaden overfishing may once again push this symbol of the Chesapeake and Potomac towards extinction. Please don't let this happen by reducing the fishing cap to allow these birds to thrive once again. Thank you for your consideration. Linda Just, concerned citizen along the Chesapeake Colora, Md

My name is Lisa Mayo and I am a Maryland resident who volunteers at Blackwater National Wildlife Refuge where we have a sizable osprey population. I am concerned about the ospreys' ability to fish for menhaden in the Chesapeake Bay. We know scientists have already recorded how the declining menhaden population is having a negative impact on osprey breeding. The Bay is proudly known for having the largest breeding population of osprey in the world - how embarrassing it would be to lose that title because our fisheries managers failed us. Please protect the menhaden population for both the osprey and Marylanders.

Controls on unregulated menhaden fishing are long overdue. I find it astonishing that a Canadian company can essentially vacuum menhaden— an essential fish in our ecosystem— with no limits or benefit to the US or regard for the consequences on wildlife. Most visibly, scientists and volunteers have documented a tragic collapse in the number of viable Osprey nests, but many other species are negatively affected. And an unhealthy and unbalanced ecosydtem is bad for our economy and recreational fishing. Do the right thing and implement controls on menhaden harvest before it's too late.

I am very much in support of lowering the caps for Menhaden fisheries. We are seeing in real time the disaster that this is creating for these ecosystems and the wildlife that depend on them for their survival. It is even more important knowing that the Menhaden are being overfished for corporate interests around supplements and dog food...certainly not things that are life threatening or worth devastating our natural world and the species on which it depends. If working class jobs are threatened by this, then we need to find sustainable alternatives to support those jobs rather than continue on the same path until those jobs disappear due to overfishing. We have to think of the next 7 generations with everything that we do. Our electeds and office holders should prioritize this more than anyone. Thank you for your consideration. I am an osprey steward for the Connecticut Audubon Society. I and other stewards observe osprey nests throughout the summer. I have firsthand knowledge that the Connecticut shoreline suffered an inordinate amount of failed nests and nestling mortalities this summer. We volunteers have observed chicks starving to death, being culled by their parents, and in many cases parents abandoning the nests due to lack of Atlantic menhaden, their primary food source. We have learned that the osprey crisis along the entire eastern seaboard is due to commercial overharvesting in the Chesapeake Bay. I, and other osprey stewards, implore the Commission to take steps to curtail these practices. Levels of human-caused osprey death have not been seen at these levels since the era before DDT was banned.

STOP VACUUMING UP THE FOUNDATION OF THE FOOD CHAIN

There comes a point when fisheries management needs to apply some common sense.

Menhaden are not simply another commercial fish to be harvested. They are part of the foundation of the marine food chain.

Striped bass eat them. Bluefish eat them. Cobia eat them. Red drum eat them. Marine mammals and seabirds depend upon forage fish.

And recreational fishermen depend upon the predators that depend upon menhaden.
Yet we continue allowing industrial-scale reduction vessels to remove enormous quantities of these forage fish from one of the most important estuaries and nursery grounds on the Atlantic Coast.

That needs to change.

I have spent more than 55 years in the fishing business. One lesson becomes painfully obvious after enough time on the water: You cannot continually remove the groceries from the pantry and then wonder why everything that eats those groceries is struggling.

The Atlantic States Marine Fisheries Commission is now considering reducing the Chesapeake Bay reduction-fishery cap by as much as 50%.

I strongly support the maximum reduction being considered — at an absolute minimum.

Frankly, I believe we need to have a much larger conversation about whether industrial reduction fishing belongs inside critical estuaries such as Chesapeake Bay at all.

This isn't about eliminating every commercial use of menhaden.

It is about recognizing the enormous difference between harvesting menhaden for bait and deploying industrial-scale purse-seine operations to capture entire schools for reduction into fish meal and oil.

LOOK AT THE ECONOMICS

According to the American Sportfishing Association, anglers used menhaden during an estimated 13.9 million fishing days in 2025, generating approximately $804 MILLION in spending and supporting more than 7,200 jobs.

That is economic value created because menhaden are part of a living recreational fishery.

But even those numbers don't tell the entire story.

What is a menhaden worth when a striped bass eats it?

What is it worth when that striped bass supports a charter boat, tackle shop, marina, hotel, restaurant, fuel dock and thousands of recreational fishermen?

What is a school of menhaden worth when cobia, bluefish, striped bass and other predators follow it?

A forage fish can generate economic value over and over again when it remains part of a healthy ecosystem.

Grind it into fish meal and that economic chain ends.

WE NEED TO STOP MANAGING SPECIES IN A VACUUM

For decades fisheries management has too often looked at individual stocks and asked:

"How many can we harvest?"

We need to start asking a different question:

"How many do we need to leave in the water?"

A forage species cannot be managed solely according to whether its own population can withstand fishing pressure.

Managers must consider the fish, birds and marine mammals that depend upon that forage.

Fortunately, ASMFC has begun moving toward ecosystem-based management through Ecological Reference Points.

Now we need management decisions with enough teeth to actually protect the ecosystem.

MY REQUEST IS SIMPLE

Adopt the strongest available reduction in the Chesapeake Bay industrial reduction-fishery cap.

Spread any remaining allowable harvest throughout the season so industrial vessels cannot concentrate enormous removals during critical periods.

Regularly reassess the cap using Chesapeake Bay-specific science.

And begin seriously evaluating whether industrial-scale reduction fishing should ultimately be removed from Chesapeake Bay altogether.

There are times when precaution is justified.

When we're talking about one of the most important forage species in one of America's most important estuaries, this is one of those times.

Menhaden aren't just another commodity.

They are FOOD.

Food for striped bass.

Food for cobia.

Food for bluefish.

Food for red drum.

Food for an entire ecosystem.

Before we spend billions trying to restore fisheries after they collapse, perhaps we should try something considerably cheaper:

LEAVE THEIR FOOD IN THE WATER.

I am a lifelong Chesapeake Bay Area resident. Annapolis, Solomons Island. I am an avid boater and naturalist. The food source failures that have resulted from gross miscalculations of menhaden harvest are inexcusable and devastating. The over-harvesting is destructive to our Osprey population and other important species that exist in and along the Chesapeake Bay and its tributaries. Baby birds are dying, if in fact they are even born. Osprey nests remain unused and full of weeds. It is shameful and a complete mismanagement of sourcing allotments. Stop this excess harvest of menhaden!!! STOP OMEGA PROTEIN FROM KILLING OUR BAY!

I fully support reducing the current menhaden quota by the proposed 50%. This is a good start but Cooke Inc aka Omega Protein should be pushed out of the Chesapeake Bay completely atleast 3 NM off the coast similar to every other state on the East Coast. They also should not be able to impede menhaden from entering the Chesapeake Bay. It also should be illegal to use spotter planes, drones, etc for the purpose of spotting menhaden. I hope you make the right decision to save this great natural resource before it's too late and has a lasting negative effect on the Chesapeake Bay ecosystem

I am a Virginia resident concerned about Chesapeake Bay menhaden as wells the species and communities dependent on a healthy menhaden population. As a birder, I'm very concerned about the Chesapeake Bay Osprey population which is in a serious decline. Mounting evidence points at the decline of menhaden in the Bay is affecting the Ospreys which can't enough food to feed their chicks. Virginia can't afford to do anything about this problem. The Ospreys are telling us that something is changing and it is not good. It isn't just Ospreys that will disappear along with menhaden. I strongly urge the Atlantic States Marine Fisheries Commission to approve conservation-minded reforms that better protect menhaden and support a healthy Chesapeake Bay ecosystem, including reducing the Bay cap by 50% in 2027 and implementing quota periods to more effectively distribute reduction fishing pressure throughout the season. Time to stop using fishing boats that vaccum menhaden out of the Bay. This is a shame for our state. Thank you for the opportunity to provide comments.

Please, oh please make the decision to limit fishing the menhaden in VA. I have kept personal notes on the osprey who nest on a pole we installed years ago. We live on Blackwater Creek, which feeds into Mobjack Bay. Initially, we simply enjoyed watching young ospreys learn to fly, to fish, and our nest was always inhabited. The last five or so years, we have had our osprey return but the nest wasn't viable. I was told by a VIMS watcher that our nest was the only viable nest within about 10 miles. I'm thrilled we have 2 chicks this year but I'm deeply worried about the future of osprey.

I have had a Osprey nest next to my pier on the Corrotoman River for over 15 years. My neighbor who lives a quarter mile away has a nest also. The Osprey have continued to come back every year. We have not had eggs or chicks in our nests the last 2 years. Basically, the menhaden are gone. Omega Protein needs to close their Reedville plant and the employees retire or find other employment. They are changing the food sources of the Bay Thanks for your attention to this matter. IL Pulling 175 Yankee Point Rd Lancaster Virginia 22503

Dear ASMFC,

I am not a biologist with a large marine research lab, but I have been fishing in the Chesapeake Bay for 50 years.
There was a time you could fill an entire cooler with fish in just 2 hours, now you go out into the York River and fish and fish and catch about three Spot in an entire afternoon.
Clearly there are fewer fish than in my youth.

50 years ago one could throw a cast net and bring it up full of Menhaden and the Menhaden themselves were fat.
Now you have to cast and cast and maybe catch 20 or 30 Menhaden / If you're lucky.

When I used to lifeguard at Yorktown Beach in 1980's the water was full of Jelly Fish. Now they are much less prominent.

All of the Aquatic Life in the YorkRiver has suffered.

How come Omega Protein can cast their nets and suck all of the Life out of the Bay.
The Fish in the Bay are really public property. Omega Protein does not own them and they are in effect stealing the Menhaden from our children and grandchildren.
The Menhaden are a key species which feeds every life-form in the Bay.

As I said: I don't have a marine research lab, but based on my own observations over decades there has been a change in the fish population in the York River/ Chesapeake Bay.

Reducing the catch Omega Protein is allowed by 50 % is in my opinion reasonable, and in fact perhaps the minimum that we should do. In all reality Omega Protein's operation should probably be shut down completely.
Their vessels suck all life out of the bay..... not just the Menhaden but everything that is feeding on the Menhaden too.

If we really wanted to make a big difference, then Omega Protein should not be allowed to operate at all.

Therefore I am strongly in favor of a 50% reduction in catch limits for the Menhaden.

They are important.
All the fish in the bay are on the decline.
Obviously the fish can't live if they have nothing to eat. I don't need any research to understand that. It's common sense.

Respectfully

Brigitte Fox

As a light tackle cried on the Chesapeake Bay, I have witnessed firsthand the difficulty that striped bass are having particularly juveniles in coming to majority. I recently took a 70 mile ride from Solomons down to the cut channel, once in Virginia Waters I saw hardly any birds, hardly any bait and, you guessed it, the big boats taking Manhattan out of the water. Manhattan harvest should be reduced by 50% until the time at which we have enough studies to determine how much forage our predator fish need and learn how to measure it appropriately.

How can it make any sense to allow the harvesting of a food source that sustains all the other life of the Chesapeake Bay? The Rockfish in the bay have largely disappeared. osprey repriduction is rapidly declining. This is not difficult: a moratorium on the Manhaden harvest should be implemented for a minimum of two years to allow the bay to recover. The economic impact of destroying the bays ecosystems is a lot more valuable than the money from the harvest.

I am a resident of Maryland with property in Calvert and Montgomery Counties, and a lawyer (Harvard Law, 1990). I have worked on fisheries management, endangered/threatened species conservation and ocean and coastal management and law for over 30 years, including for the U.S. Senate Commerce Committee. I am deeply concerned that the current fishing limits on Menhaden are insufficient to 1) ensure long-term viability for the fishery, and 2) to ensure the survival of the iconic Chesapeake Bay bird species, the Osprey. The evidence from both scientific surveys and sightings by residents and bird observers indicates that the Osprey reproductive success rate has significant worsened, with chicks starving - tied to lack of Menhaden. Therefore, I urge the Board to take immediate action to reduce fishing pressure on Menhaden, to allow their recovery and to support the wild species that rely on them for their survival. With thanks for your consideration, Amy A. Fraenkel, Esq.

Board Members: I am a lifetime resident of Virginia, a sport fisherman, and, perhaps, most importantly a grandfather. I want my grandchildren to enjoy the wonders of Virginia's waters as I have. I am most alarmed by the decline in striped bass and osprey populations. It seems the brown pelican population is declining as well. I strongly believe that the overfishing of menhaden is a contributing factor. I support a 50% reduction in the bay cap and the use of quota periods. Thank you for considering my input, Robley Shelton Jones

I think menhaden netting should not be allowed in the the bay period. They can fish in the ocean and leave the bay alone. I have been fishing in the bay when omega boats have shown up. After they are done netting there are no fish of any kind left in that area. I have also noticed that the osprey population has been dwindling the last several years and so has fishing in the Rappahannock river. I also don't understand why omega is allowed to fish in the Rappahannock river east of the route 3 bridge. The over fishing by omega may result in the same outcome of the Pacific sardine fishery.

We own a home on Prentice Creek near Kilmarnock VA and in close proximity to Reedville. While understanding the importance of the Menhaden reduction facility to Reedville, it in no way is commensurate to the disaster being caused to the Bay ecology by over-fishing of the Menhaden which is a foundational component to Osprey, Rockfish and other species. It is imperative that the guidelines proposed by the Chesapeake Bay Foundation based upon the William and Mary study be adopted immediately. In the battle between the vitality of the Bay and special interest groups the answer is a no-brainer. Support and vote to support the Menhaden and the vitality of this irreplaceable resource.....a vibrant Bay.

While fishing in the Chesapeake Bay near Cape Charles, Virginia over the past few years, sometimes in water as shallow as 20 feet, on numerous occasions I have been forced to move my small center console out of the way as Omega ships blast 4 warning horn signals for me to get out of the way as they trawl for menhaden very close to shore. They are overfishing the bay by exceeding their quotas each year and paying paltry fines while greasing the palms of lobyists. As a result the commercial and recreational fishing industry both have suffered in the bay. Please, once and for all, let's keep the pressure on and find a way eventually to ban Omega from fishing in the bay whatsoever so that Virginia is in accordance with every other state on the east cost in this regard. Thank you for your consideration on this matter.

As an Osprey Steward for the past 11 years, to observe what has happened to our osprey population over the last 2 years in particular is horrifying. The nesting osprey on our property, as well as all of our local nests, have suffered tremendously due to the lack of menhaden. Not only have 90% of the babies died but we have no idea how the adults have fared as most of them disappeared after their babies died. The solution has to lie in restricting the harvest limits of menhaden. This doesn't require a genius to figure out! Just do it now please.

I strongly support a substantial reduction in the industrial harvest of menhaden in the Chesapeake Bay, including the maximum 50% reduction currently under consideration. Menhaden are not simply another commercial species—they are one of the most important forage fish in the Chesapeake Bay and along the Atlantic coast. Striped bass, bluefish, weakfish and many other predators depend heavily on these fish as a food source. Removing enormous quantities of menhaden for reduction into fish meal and oil takes forage directly out of an ecosystem that is already struggling to support its predator populations. Even if the coastwide menhaden stock is not officially classified as overfished, that does not mean localized depletion within the Chesapeake Bay is not a serious problem. We need to manage menhaden for their value to the entire ecosystem, not simply for the amount that can be commercially harvested. A healthy abundance of menhaden benefits recreational fishing, commercial fishing, birds, marine wildlife and the overall health of the Chesapeake Bay. Please significantly reduce the Chesapeake Bay reduction harvest and leave more menhaden in the water where they provide far greater value to the Bay and everyone who depends upon it.

Dear Sir or Madam: I submit these comments as a supporter of efforts to sustain and expand healthy osprey populations, and as a member of Connecticut Audubon Society. Connecticut Audubon Society surveys have documented reduced breeding success for osprey nests monitored by the Society's Osprey Nation program, in which I have participated. Specifically, those surveys show 1 in 6 osprey nests failed in 2025, and 1 in 4 nests have failed in 2026. Ospreys feed almost exclusively on fish. The decline in osprey reproduction rates serves as a warning about the health of Atlantic waters and the abundance of prey species, such as Atlantic menhaden. Accordingly, I urge the ASMFC to reduce the menhaden fishing cap by 50% to provide for sufficient menhaden to support a healthy osprey population, and to create quota periods to allocate permitted harvest more evenly throughout the fishing season. I believe that public policy in this area must be sensitive to the decline of bird and animal populations as indicators of potentially more widespread environmental harm. I commend the ASMFC for its attention to these issues. Respectfully submitted, David M. Kozak

I have been involved with CT Audubon's Osprey Nation project for the past nine years as a steward of several osprey nests in the town of Old Lyme. I've observed and reported each year, and up until 2026, had only one unsuccessful nest. This year I've noticed a dramatic difference. Not only did the two nestlings in the nest closest to my home not survive, I believe due to lack of food, additionally the skies are quiet. Where in past years, dozens of ospreys circled overhead all summer long, I now see very few. Other stewards I'm sure have reported the tragic conditions at Great Island in Old Lyme, where only 7 nests among dozens successfully fledged chicks. All evidence points to a lack of menhaden, which was once plentiful along the CT shore. I strongly urge those responsible to reduce the Chesapeake Bay menhaden fishery cap by 50% or more to help replenish the fish population, and hopefully keep osprey from once again becoming endangered. People have worked hard to help the osprey rebound from near extinction due to DDT. Let's not let these beautiful birds suffer that fate again. Thank you.

I have fished off the coast of Delmarva for the last 15 years. Since Omega has been commercial fishing menhaden I have noticed less osprey and their chicks. I don't see as many pods of dolphins near shore. Mahi mahi are peanuts instead of bailers and gaffers. Tuna is never great by mid summer, but now there is almost none. You can't keep taking the food source for all these organisms and not have an impact. They are allowed to chase menhaden with planes and multiple boats to take all the schools of menhaden. Why are we allowing Omega to destroy a vital link in the food chain? They literally go up and down Delmarva and NJ as a massive commercial monster taking all the food for the rest of the animals food. This puts unnecessary pressure and stain on other food sources and wrecks the ecosystem.

How long do we have to watch our fish numbers decline in the bay? There used to be hundred of striper in schools next to the CBBT islands…now a handful. There used to be thousands of cobia on the CBBT before their migration and now they are sporadic and scattered. Why does a Canadian company have the right to cause such destruction in the Chesapeake Bay? Yes it makes a difference and I have personally felt the downstream effects of this destruction.

Please stop the overfishing of the Menhaden- It is creating a big disruption in the overall food chain, not just for the Osprey but for many other species as well. This will have consequences beyond our expectations, especially for the next generation!

Please cut the cap for the Chesapeake bay. I have lived in the bay for 15 years. We don't have osprey in our creeks any longer that is a fact. I don't see birds of any sort on the bay any longer. I don't fish bay anymore as it seems to be a dead zone regarding all the fish we used to take for granted. please help and do what is needed.

I like to fish for Striped bass in the fall and back in 2011 stipers were so abundant I could feed my family a striper dinner once a week throughout striper season. when they opened that fertilizer plant on the Eastern shore, the bite started going down now today 15 years later you can't catch any Schoolies or anything. they are clearly over Fishing the menhaden and it has to stop! it will already take at least 10 years to recover from the damage they have already done. I have seen their trawlers in the bay where I thought they were supposed to stay in the ocean. They do what they want, and it has to stop! Somebody please help! Thank you

Waterford nest #6, cranberry pond. As an Osprey nest monitor for 10 plus years, my nesting ospreys would have one or two successful fledglings . Sadly , during the last 3 years (2023-2026) the ospreys on yhis nest have failed to reproduce. It appeared to be a lack of food because the female would sit on the nest calling for long periods without the male bringing food. I live next to this nest so my observations were daily and lengthy.

I support reducing commercial menhaden fishing as much as possible. I have seen a notable reduction in successful osprey nests along the Chesapeake Bay. Commercial menhaden fishing does nothing to help the local community or ecosystem. Help protect the Chesapeake for the locals - the wildlife in and around the Bay and the people who enjoy living, working, and playing on the Bay.

My husband and I have been monitoring the osprey nest at the channel marker to Southport, CT harbor. Initially, we saw two chicks, but sadly only one has survived to fledge. Please reduce the amount of menhaden fisherman are allowed to catch. More fish matters to the osprey and the other seabirds as well as the fish we see in Long Island Sound. Best, Judy & Ched Proctor

As a conservation minded Newyorker, I support enhanced regulation that would protect and increase the bunker population available to the entire food chain by taking steps to limit the overfishing practices of the commercial industry by removing it in numbers thatdeplete the fish, at times of the year and in places where they must be found in sufficient numbers and limit the fishery for bunker that removes them from the food chain as needed.

RE: Public Comment in Strong Support of Draft Addendum II to Amendment 3 to the Atlantic Menhaden Interstate Fishery Management Plan

Dear Members of the Atlantic Menhaden Management Board:

As a concerned coastal resident of Essex, Connecticut, living along the Connecticut River and the Long Island Sound watershed, I am writing to express my strong support for Draft Addendum II. I urge the Board to adopt the most protective options available: a 50% reduction in the Chesapeake Bay reduction fishery cap and the strict implementation of seasonal quota periods.

While the reduction fishery operates primarily in Virginia waters, the health of the Chesapeake Bay directly impacts our entire Atlantic coastal ecosystem. Atlantic menhaden are migratory fish. The localized depletion caused by industrial-scale purse-seine netting in their primary nursery waters directly starves the wildlife that balances our local ecosystem here in New England.

In Essex, our identity is deeply intertwined with our coastal environment. Over recent years, residents like myself have watched with growing alarm as our local osprey populations struggle. The sight of these magnificent birds of prey returning to empty nests or failing to successfully fledge chicks due to a lack of available forage fish is heartbreaking and ecologically unacceptable. Multiple scientific and field observations have linked failing osprey nesting success directly to menhaden scarcity.

To address these critical ecosystem failures, I urge the Board to implement the following measures:

1. Adopt a 50% Reduction to the Chesapeake Bay Cap: Lowering the cap from 51,000 metric tons to 25,500 metric tons is a necessary, precautionary boundary. It reigns in concentrated industrial extraction in vital nursery waters, leaving more forage fish in the water to support struggling predators up and down the coast.
2. Implement Seasonal Quota Periods: Spreading the allowable harvest across distinct periods stops industrial fleets from exhausting the annual cap during a few intense summer weeks. This gives menhaden schools the time and space to migrate safely out of the Bay and travel northward up the Atlantic coast.
3. Maintain Strong Coastwide Linkages: The Chesapeake Bay cap must dynamically shrink whenever the coastwide Total Allowable Catch (TAC) is reduced. This ensures industrial pressure does not intensify inside the Bay when ocean-facing quotas

are tightened.

Ecological failure is a devastating consequence of reactive management. We all should take responsibility when our action impact species that suffer at the cost of just trying to survive. The ASMFC has a commitment and responsibility to ecological management and to steward proactive practices that preserve ecological systems. Please prioritize the long-term health of our shared Atlantic ecosystem, our coastal communities, and iconic species like the osprey over short-term commercial extraction. Thank you for your time and your dedication to protecting our public marine resources.

Sincerely,

Sierra Farris
Essex, Connecticut Resident

3.1 Chesapeake Bay Reduction Fishery Cap Amount Option C1.e: 50% reduction to 2026 Bay Cap: 2026 TAC 3.2 Chesapeake Bay Cap Distribution 3.2.1. Quota Periods: Option B1: Even Length & Even Harvest 3.2.2 Quota Period Overages and Underages Option B. Quota period overage payback with rollover of unused quota within a fishing year 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision Option B. Revisit Provision. Since empirical data on the ecological impact of the menhaden reduction industry's harvest of these fish does not exist, we must rely on anecdotal observations. The general decline of significant menhaden predator fishes and the declining harvest of the menhaden bait industry in the Chesapeake Bay indicate a need for reducing the Bay Cap and then allocating that over the year using three harvest periods. ASMFC should also revisit the Bay Cap every three years. Thank you for the opportunity to comment.

From my home near Ingram Bay in the NNK of VA I have seen zero osprey this year and only one pair last year who abandoned their nest early in the summer before attempting to raise a chick. Two summers ago a pair tried and failed to raise a chick there. I have boated all over Cranes Creek and the Great Wicomico and nest boxes that used to be full are unoccupied. The skies are silent. The osprey are unable to catch enough food to survive here. This sad trend has been playing out for the past several years and is obvious to anyone who pays attention to the Bay. Menhaden are a shared biological resource and Omega is taking way more than their fair share. Wake up ASMFC!

Menhaden is the foundation for many of the species of birds, mammals, and fish in the Chesapeake Bay. While worldwide the menhaden are not endangered, they are in the Bay. The highly efficient commercial harvesters are reducing the population which in turn is negatively affecting other organisms that depend on them. Reduce the allowable catch to permit the population to rebound before it is too late and the ecosystem collapses.

Hello, I am from coastal Maine and are lucky enough to see osprey, both flying and in their numerous nests, on a daily basis. I was distressed to read about the overfishing of menhaden in Chesapeake Bay by the Canadian company Omega Protein, and the resulting loss of food for osprey. The numbers of decline are alarming, and cause for prompt action now. I am advocating for a decision to limit the numbers of menhaden that can be taken so that nature can be in balance again and osprey can continue to thrive. Thank you for your consideration of this important issue .

To whom it may concern.

As an avid striped bass fisherman for many years, I have noticed the absence of small fish—their numbers seem to decrease each year.
All signs point to an overharvesting of menhaden, which, has become so blatant, it is disgusting.

I urge the commission to cut the menhaden harvest drastically. It is the only hope to sustain the fishery.

John

Categories: Menhaden 2 Auto Replied

For four years I have been an observer of osprey behavior at Chesapeake Bay Environmental Center in Grasonville, MD.

Under the direction of Dr. Judy Wink, director emeritus at CBEC, myself and other volunteers learned about osprey behaviors including arrival/claiming a platform; courtship/mating/nest building through egg production, hatching, fledging and departure. The information was reviewed and discussed every year just before osprey were expected to arrive. We had schedules to follow including reports sent to the College of William and Mary, all under the guidance of Dr. Wink.

For the last two years the nest I monitored along with other volunteers had osprey appear interested in the site but nothing came to fruition. The nest building was minimal in 2025 and practically none this year, 2026. In fact, there were no nests producing osprey young at CBEC in 2026.

This is tragic! The osprey cannot produce young when there is not enough food - predominantly menhaden - for adults much less the nutrition it takes to produce young. The exploitation of menhaden must stop immediately. The longer we wait to do something about this situation, the worse it is especially for osprey. Do not let this important, majestic and iconic bird be driven to starvation. Strict and immediate laws and regulations must be implemented to protect menhaden and hence ospreys.

Thank you.

I own a property at the Jersey Shore, and have always enjoyed watching the ospreys fish in the ocean, off of our beach.
This summer, we thought there were less ospreys than usual. We also saw many more unsuccessful attempts at fishing.
I have read that the osprey have had the worst breeding season in more than three decades, and that the osprey reproduction rates fell by more than half statewide, due primarily to the overfishing of menhaden. I am alarmed by the plummeting coastal osprey population, and urge the Atlantic States Marine Fisheries Commission to drastically reduce the allowable menhaden harvest.
Thank you for your time.
Sincerely ,
Mary Ellen Cairns,
201-956-3085

Data shows the TAC (total allowable catch) has been cut and cut and cut. Yet the osprey and recreational fishing industry continues to claim the bay is getting worse and worse and worse for Rockfish and Osprey. Where is the correlation between cutting the TAC and improving the ecosystems for Rockfish and Osprey. Clearly, there is no correlation.

However, there is a correlation between the migration of people from Eastern Pennsylvania, New Jersey, Delaware and Northern Virginia into the Bay area and the decline of Rockfish and Osprey. In addition, there is data to verify that when people move to an area they destroy the habitats of other species and misuse natural resources. Three examples,

1. When Ranchers moved into the western states, they annihilated the wolf and started a chain reaction for that ecosystem.
2. When the two coasts were connected via the railroad, the buffalo was almost brought to the point of extinction.
3. The abuse of water in the west, particularly around Las Vegas (Lake Mead) is being drained to critical levels.

The destruction of habitats by humans is nothing new, but it is new to the Bay.

A primary invisible killer growing in the Bay? Algae
1. People migrate to the water and plant lawns that require phosphate and nitrogen. Food for algae.
2. Septic fields (hundreds maybe thousands) leach BOD into the rivers and creeks. Again food for the Bay.
Other habitat killers…
Grasses needed to hide fingerlings are replaced with rip wrap to stop the erosion caused by the cutting down of shoreline trees. Trees removed to provide that all important "view of the water."

The list could be much longer, but I believe the point has been made. Humans are the root cause for the pressures on Rockfish and Osprey.

If the migration and human demands on the Bay are not stopped. We will shortly start to see **ALGAE BLOOMS**. The Bay is following the same path as the Great Lakes. Search the web for images of algae blooms on the Great Lakes.

This emotional craze about fishing Menhaden has to stop. And ASFMC has to have the courage to tell the facts. There needs to be a refocus on this migration and direct help for Rockfish.

Solutions

1. Immediately, implement a moratorium on fishing Rockfish in the Bay. This was done around 1980 and was very successful. It took about five years to re-establish a healthy Rockfish population. A PROVEN SOLUTION. I would consider making it permanent. There are plenty of Rockfish in the ocean.

2. Legislate and stop the migration.

3. New State and Federal tax laws to provide a revenue stream to poor counties surrounding the Bay. Currently, their prime revenue stream for these counties is selling land for development - this only perpetuates the problem.

4. Eliminate issuing small boat "non residential charter captain" licenses. The increase in licenses, since 2000, validates the influx of pressure on the Bay. Plus, it is another reason why large boat charter captains are being put out of business.

Leave the Bay TAC at 51,000 metric tons.

Thank you,

Dave Scanlon

Categories: Menhaden 2 Auto Replied

Good day. Please enforce tighter limits on menhaden fishing to secure the future of ospreys. The state also needs to relist the species to allow for a comeback. We watched many osprey this season from our boat docked on the Hudson in Piermont, the most we've ever seen. Based on the abundance of sightings, I was surprised to learn that the hawks were endangered in the Atlantic & Chesapeake Bay.
Thank you for protecting these magnificent birds, Deborah Endresen

Subject: [External] Menhaden

Categories: Menhaden 2 Auto Replied

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC)

We have owned waterfront property in Saint Mary's County, Maryland, since 1998. We have enjoyed watching the ospreys nest next to our dock all these years until 2020. We typically had a nesting pair return every year producing 2 or 3 chicks. It was so much fun watching them learn to fly from the nest to the pilings on our dock, where they sat gathering the courage to fly back. After 2020 the ospreys returned, but no chicks were produced. We kept wondering why. In the summer we buy menhaden for crab bait. In the last few years the average size of the menhaden has gone from 8”-12” to only 4”-6” long. We recently connected the size/loss of menhaden to the lack of osprey propagation.

I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.

The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - menhaden.

Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. Where and when the fish are removed matters.

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.

I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.

For that reason, I urge the Commission to establish strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months. Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coastwide fishery.

There is also an important management issue that deserves attention. The Commission's coastwide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.

I respectfully urge the Commission to:

1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.

2. Establish firm seasonal quota periods for menhaden.

3. **Prevent excessive concentration of reduction harvest during the summer months.

4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.

5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.

I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting.

The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake.

Sincerely,

Mike and Linda Aldridge

Categories: Menhaden 2 Auto Replied

Atlantic States Marine Fisheries Commission,

I am writing to express my serious concern about the dramatic decline in coastal osprey populations and to urge the Commission to take stronger action to protect Atlantic menhaden.

Menhaden are not simply another commercial fishery. They are a critical forage species that supports ospreys and many other predators throughout the Atlantic coastal ecosystem. When menhaden become scarce in areas where ospreys feed, the consequences can extend throughout the food web and can be particularly damaging during the nesting season, when adult birds must find sufficient food for their young.

The continued decline of coastal ospreys should be treated as an important warning sign. Fisheries management should account not only for the sustainability of the harvested species itself, but also for the needs of the wildlife and ecosystems that depend upon it.

I strongly urge the ASMFC to substantially reduce the allowable menhaden harvest, particularly in ecologically sensitive coastal areas, and adopt management policies that explicitly account for the forage needs of ospreys and other predators.

We should not wait until these populations reach a crisis point before taking meaningful action. A healthy menhaden population is essential to a healthy Atlantic coastal ecosystem.

Thank you for considering these concerns and for your stewardship of our marine resources.

Sincerely,

Terrence Curran
Cranford, NJ

Dear Mr. Boyle,

On behalf of the Jersey Coast Anglers Association and our 35 member clubs representing more than 5,000 New Jersey anglers, we support meaningful changes to the Atlantic menhaden Bay Cap outlined in Draft Addendum II.

JCAA Official Comment Letter is attached.

Please take the time to read the letter carefully and understand the critical importance of Atlantic menhaden to our coastal ecosystem, recreational fisheries, wildlife, and the economic health of our coastal communities.

The need to protect this essential forage fish is urgent. The decisions being made now will have long-term consequences, and we must act before it is too late.

Respectfully,
Mark A. Taylor
President, JCAA

Subject: [External] Atlantic Menhaden Draft Addendum II, Protect Menhaden

Categories: Menhaden 2 Auto Replied

Dear Atlantic States Marine Fisheries Commission (ASMFC),

The Chesapeake Bay osprey population is experiencing an unprecedented reproductive crisis driven by severe food stress, with population sustainability falling below the historic lows seen during the DDT era of the 1960s and 1970s. Researchers are finding an increasingly alarming number of starving chicks unable to survive their first few weeks, and nutritional deprivation is so severe that a substantial portion of female ospreys are failing to lay eggs entirely. In fact, in some areas 74 percent of the pairs nesting failed to produce any young. Current reproduction rates have plummeted far below levels to sustain osprey with an expected decline of 14% of the osprey population annually.
I support the long overdue restrictions on menhaden proposed in Addendum II of Amendment 3 to the Interstate Fishery Management Plan for Atlantic Menhaden. I specifically support the following proposed limits and would further support a complete menhaden fishing moratorium should that be considered:

- 3.1 Chesapeake Bay Reduction Fishery Cap Amount: Support option C1e that would Reduce the Bay Cap by 50 percent and limit it to 13.6 percent of the Coastwide Catch Limit (TAC) and also support option C2a which sets an upper limit of 51,000mt for the Bay Cap, which is the current level.
- 3.2 Chesapeake Bay Cap Distribution: Support option B2 which establishes three even length quota periods for the Bay Cap, but distributes harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. We support option B which establishes quota period overage payback and rollover of unused quota within a fishing year.
- 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: Support option B Revisit Provision to reassess the efficacy of these new management tools every 3 years.
We have waited far too long to act to protect menhaden which are critical to ospreys and many other species of Chesapeake Bay wildlife.

Sincerely,

Andrew Hinz

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

I support the following selected alternatives for the Chesapeake Bay Cap, as ecologically and socioeconomically appropriate, to inform effective management actions, reduce the risk of overfishing, and promote resilient futures for the resource and its communities.

3.1 Chesapeake Bay Reduction Amount
: Sub Option B4 – a 50% reduction in the current Bay Cap, resulting in a Bay Cap of 25,500 mt.

3.2.1. Chesapeake Bay Reduction Fishery Cap Quota Period
: Option B1 – Even Length & Even Harvest.

3.2.2 Chesapeake Bay Reduction Fishery Cap Quota Period Overages and Underages
: Underage Sub Option 1 – an underage in Quota Period 1 would be split evenly and rolled over to Quota Periods 2 and 3.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision
: Option B – The Chesapeake Bay Cap will be reviewed at least once every three years.

The coastwide TAC must be reduced by at least 30%, from the current 186,840mt to 130,788 mt. Ideally, the coastwide TAC should be reduced by 50%, lowering the operating TAC to 94,420 mt. These are the only options to ensure the coastwide commercial Atlantic Menhaden fishery operates at a capacity that does not carry a 100% probability of overfishing.

Thank you for your time,

-Paul Archibald

Subject: [External] Reduce allowable menhaden harvest

Categories: Menhaden 2 Auto Replied

I've been watching the webcams aimed at the nests of a number of ospreys. Ospreys are such magnificent birds and I thought it would de-stress my day to watch the mystery of life from the laying of eggs through fledging.

HAH!

Instead, this is what I've seen:

Fathers not bringing food regularly to the nests or abandoning the nest altogether Mothers leaving the nest in search of food for her babies or herself Mothers abandoning the nest altogether Nestlings killing siblings Nestlings starving to death

This is horrific! And what is the common denominator? I've since learned that a recent lack of a plentiful supply of available fish, mainly menhaden, has caused the coastal osprey population to plummet with no help in sight.

I am begging you to drastically reduce the allowable menhaden harvest! It's disgraceful that, after DDT was banned and the osprey were finally removed from the NJ endangered list in January 2025, we are now faced with another man-made tragedy.

Thank you in advance for doing the right thing for these beautiful birds.

Sincerely,
Lynn Conley

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear ASMFC,

I am writing to formally request immediate regulatory action regarding the management of menhaden in the Chesapeake Bay. Menhaden are a critical food source for striped bass, bluefish, red drum, sea trout, and other important sportfish. The populations of most marine fishes are in distress not due to overfishing, but because they are STARVING to death as their food source vanishes, causing the biomass of these species to dwindle despite strict fisheries regulations. (Some of these recreational fishing regulations are ridiculous and have little or no impact on population management.)

To protect the marine ecosystem, restore essential food sources, and support local wildlife populations, I urge you to implement the following measures:

1. Ban the harvest and landing of menhaden in the Chesapeake Bay for at least 5 years.
2. Reduce the overall menhaden harvest and landings by a minimum of 50% for at least 10 years.
3. Continue to rigorously monitor and evaluate the results of these restrictions to assess ecological recovery over time.

Thank you for your time, leadership, and consideration of this critical conservation issue.

Sincerely,
Wayne "Bud" Ford
Yardville, NJ

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Mr. Boyle

I am greatly concerned about the health of our oceans and coastal wildlife. That's why I'm asking the Atlantic States Marine Fisheries Commission to strengthen how it manages Atlantic menhaden, a small but essential forage fish.

Atlantic menhaden play two roles in our oceans: they're a crucial food source for everything from ospreys and herons to whales and striped bass, and they filter plankton from the waters of the Atlantic coasts as they feed.

Sustainable fishing can coexist with a healthy, abundant menhaden population, but achieving that balance requires management that fully accounts for menhaden's dual role: feeding wildlife and potentially influencing coastal water quality — not just traditional catch limits. Addendum II is a step in the right direction, but it doesn't go far enough to ensure menhaden remains a healthy, abundant part of our coastal ecosystems.

I'm asking you to:

-Fully account for menhaden's role as a food source for birds, whales, and fish, and their role in filtering plankton for our coastal waters, in your management decisions.

-Adopt strong, science-based management that preserves menhaden as a robust food source for its predators.

-Expand management tools to prevent excessive catch during critical times and areas, distributing fishing pressure more evenly throughout the season.

-Commit to promptly updating menhaden management as new science and assessments become available.

Atlantic menhaden are too important to get this wrong. Please strengthen protections for this vital fish before it's too late.

Sincerely,

Bill Evans

Subject: [External] Support for Atlantic Menhaden Conservation (Draft Addendum II)

Good morning, Mr. Boyle:

As a devoted advocate for the health of our coastal waters and the daughter of two residents of Reedville, Virginia, I am writing in fervent support of stronger conservation measures under the Atlantic States Marine Fisheries Commission's (ASMFC) Atlantic Menhaden Draft Addendum II. I vigorously support the approval of a 50% reduction in the Chesapeake Bay reduction fishery cap and establish seasonal quota periods.

Atlantic menhaden are a foundational forage fish. Ecologically, they are critical to the survival of sportfish like striped bass and blue fish, as well as avian predators like ospreys, which are currently suffering from historic nest failures and starvation due to localized food depletion. In addition, an over-concentration of industrial reduction fishing by Ocean Harvesters/Omega Protein has devastated local bait watermen and small-scale commercial operations who rely on stable menhaden populations.

The current industrial cap of 51,000 metric tons allows a highly centralized fleet to extract massive quantities of this ecological anchor from sensitive nursery grounds. Implementing a 50% cap reduction and spreading the remaining harvest evenly across the season will protect the broader Atlantic marine ecosystem and support the coastal economies tied to recreational fishing and tourism.

Thank you for the opportunity to submit these comments in support of protecting our vital public marine resources.

Subject: [External] Atlantic Menhaden - Support for Harvest Reduction!

Categories: Menhaden 2 Auto Replied

Dear Mr. Boyle:

We live on the Magothy river and have witnessed first hand the decline in the river and bay fishery and strongly support a 50% reduction in the Chesapeake Bay fishery cap (Option B4/ reducing the cap to 25,500 metric tons) and support seasonal quota periods!

Together with the stressed populations of striped bass, these declines signal an URGENT need for precautionary conservation practices NOW.
Industrial reduction fishing extracts over 100 million pounds of fish in a concentrated summer window, harming the local food web and depriving other groups, especially watermen and anglers, of fair access.
We urge fishery managers to implement strict quota periods that will distribute the harvest evenly across the year rather than allowing an intense summer harvest.

Thank you for being a responsible steward of the entire Bay ecosystem before it is too late!

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

To the Atlantic Menhaden
Management Board,
I support:
Cutting the Chesapeake Bay Cap by the full 50%
• Linking the Bay Cap to the coastwide catch limit, so when one drops, the other does too
• Spreading Bay harvest across quota periods so the Bay isn't stripped in spring and summer
Reducing the coastwide catch limit by 40% to meet Science for 2027 and beyond

I am writing to support the most conservative options in Draft
Addendum II.
Please reduce the Chesapeake Bay Reduction Fishery Cap by the full 50%, link the Bay Cap to the coastwide total allowable catch, and divide the Bay Cap into quota periods so harvest isn't concentrated in the spring and summer.
lalso urge the Board to set a coastwide TAC for 2027 and beyond that meets the ecological reference point target. The 2025 assessment showed the stock is smaller than previously
estimated, and the Board's own projections found a cut of 50% or more was needed to meet that target.

Thank you for considering my comments.

Thank you,
Kevin Kelley

Subject: [External] NJ's Ospreys

Categories: Menhaden 2 Auto Replied

New Jersey's ospreys are in deep trouble.
Because of overfishing, these incredible raptors face their biggest threat since DDT almost drove them to extinction in the 1960s and early 1970s. Here's what's going on. Industrial fishing operations are systematically removing schools of menhaden from the Atlantic coast and Chesapeake Bay. Humans may not find these small, thin fish palatable, but there's plenty of money to be made from harvesting them for bait, animal feed, fertilizer, and nutritional supplements.
To maximize their yield, the massive operations use spotter planes to locate the menhaden, then send their ships to scour the water with huge nets.
According the New Jersey DEP, commercial fishermen have removed more than 400 million pounds of menhaden annually along the Atlantic coast in recent years. Although there are catch limits on menhaden, the current limits seem inadequate, unsustainable, and deadly to ospreys and the marine ecosystem.

I am alarmed by the plummeting coastal osprey population I urge them to drastically reduce the allowable menhaden harvest.

Subject: [External] Lower the cap on Menhaden harvest by 50%

Categories: Menhaden 2 Auto Replied

Dear Board Members,

Some decisions are hard, some are easy. This is an easy decision. Osprey are a national treasure for everyone to enjoy. Commercial fishing needs to be controlled to protect our treasures.

Please lower the cap on Menhaden harvest in the Chesapeake Bay by the largest percentage you can to protect our national treasures for us, our children, and our grandchildren!

Thank you.
Respectfully,
Carolyn Krier

Subject: [External] Request for Stronger Menhaden Protections in the Chesapeake Bay – Support for Draft Addendum II Options

Categories: Menhaden 2 Auto Replied

Dear Mr. Boyle and Members of the Atlantic Menhaden Management Board,

CC: Virginia ASMFC Delegation

I am writing to urge you and the Atlantic States Marine Fisheries Commission (ASMFC) to adopt conservation-minded reforms that safeguard menhaden and support a healthy Chesapeake Bay ecosystem. Menhaden play a critical role as a forage fish for stripers, osprey, marine mammals, and many other species that depend on a balanced Bay.

My family owns and runs Mossy Creek Fly Fishing, and through their conservation efforts, I've seen how deeply interconnected our waters are, and why protecting them is essential for future generations. Menhaden may be small, but permitting their overharvest sets a reckless precedent—and we cannot afford to risk the collapse of a vibrant Bay.

To ensure the long-term health of the Bay and reduce the localized depletion caused by concentrated industrial reduction fishing, I strongly call on the ASMFC to approve key measures in **Draft Addendum II**:

- **3.1 Chesapeake Bay Reduction Fishery Cap Amount:**
  - **Support Option C1e:** Reduces the Bay Cap by 50 percent and limits harvest in the Bay to 13.6 percent of the Coastwide Total Allowable Catch (TAC).
  - **Support Option C2a:** Sets an upper limit of 51,000 metric tons for the Bay Cap, capping it at current levels to prevent future expansion.
- **3.2 Chesapeake Bay Cap Distribution:**
  - **Support Option B2:** Establishes three equal-length quota periods across the season, distributing harvest as 25 percent in Period 1, 25 percent in Period 2, and 50 percent in Period 3 to spread out fishing pressure.
  - **Support Option B:** Implements quota period overage paybacks and allows the rollover of unused quota strictly within a single fishing year.
- **3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision:**
  - **Support Option B:** Mandates a Revisit Provision to evaluate the effectiveness of these management tools every three years.

By approving these options, the ASMFC can take meaningful action to prevent localized depletion and protect the overall health of the Chesapeake Bay for future generations. Thank you for your leadership and consideration of these critical conservation measures.

Sincerely,

Laura Trow

Subject: [External] Menhaden quota comment

Categories: Menhaden 2 Auto Replied

My name is Jacob Knowles, and I am a fifth generation lobster fisherman from Downeast Maine. I support reallocating more of the coastwide menhaden quota to the Northeast, and I want to focus on one reason I believe deserves more attention: the size, and therefore the number, of fish being harvested.

I have fished here my whole life, and I never personally saw menhaden in our local waters until around 2017–2018. Since then, we have seen large adult menhaden become an important seasonal presence. Meanwhile, I regularly hear fishermen and bait suppliers farther south describe smaller fish and fewer of the large menhaden they used to see.

As lobster fishermen, we source bait from up and down the coast, and the difference matters. Larger menhaden are preferred for our bait needs. Smaller fish are harder to use, yet we often end up buying and trucking them long distances while large menhaden in massive numbers are available close to home.

My main point is simple: a quota measured in pounds or metric tons does not tell the whole story. I think how many individual fish are needed to reach that weight should be taken into consideration here. For example, if a large menhaden, at the end of its life, weighs two or three times as much as a small one, harvesting that larger fish fills the same amount of quota as harvesting two or three smaller fish.

Reallocating quota would not require increasing the coastwide harvest limit. It could instead shift some of the existing harvest toward areas where larger fish are available, inevitably reducing the total number of individual fish removed for the same harvested weight. I believe that possibility deserves serious consideration when evaluating allocation and its effects on the stock.

The benefits to Maine's bait supply are also substantial. We face an ongoing bait shortage, yet we spend money and burn fuel transporting smaller menhaden from other states. These fish are harvested under the same coastwide quota, while we steam past schools of larger fish in our own waters that we cannot fully utilize under our allocation.

I am asking you to consider both where menhaden are available today and how fish size factors into the use of the coastwide quota. Allocating more quota to Maine could provide much needed relief for our lobster industry, reduce unnecessary transportation, and better

match the harvest to the fish available. The potential benefits to the menhaden stock deserve evaluation as part of that decision.

Thank you for your time and consideration.

Jacob Knowles

Subject: Atlantic Menhaden Draft Addendum II

Dear Members of the ASMFC

I strongly support a substantial reduction in the allowed menhaden catch within the Chesapeake Bay immediately, and for the years necessary to allow full recovery of the osprey, striper, and other populations within the Chesapeake Bay. I have no objection to the menhaden catch outside the Bay.

Menhaden serve as a critical food fish within the Bay. The commercial catch by the menhaden fishery directly competes with the adequate feeding of parental and juvenile osprey, as well as other species such as striped bass. In recent years we have witnessed multiple cases of the starvation of osprey chicks with adult osprey unable to bring fish to the nest. The recreational and commercial catch of striped bass has also declined sharply.

All evidence strongly suggests that the direct competition by the commercial menhaden fishery for this vital food source is strongly adversely affecting the osprey breeding success rate as well as the recreational and commercial striped bass fishery.

Please eliminate this competition by sharply reducing the allowed menhaden catch within the Chesapeake Bay.

Subject: [External] Atlantic Menhaden Draft Addendum II and 2027–2029 Catch Limits

Categories: Menhaden 2 Auto Replied

To whom it may concern,

My name is Katelyn McFadden. I live in New York, in Rockaway, Queens, which is surrounded by the Atlantic Ocean and Jamaica Bay. I am a reporter in the area and I've been hearing from fishermen, bait shop owners and environmentalists that the reduction fishery purse seine fishing operations off the Atlantic coast are having detrimental effects on the menhaden population. Our osprey nesting season in Jamaica Bay was horrendous, with 20 out of 25 nests empty and only five chicks born this season, as they're having a hard time finding menhaden to feed on. Fishermen and charter boat captains are claiming they aren't seeing many menhaden, which is impacting their fishing season for stripers and bluefish, which feed on menhaden. The bait shops are getting smaller and smaller menhaden and having fewer fishermen come into their shops since the local fishing is so bad now.

They are all attributing this depletion of menhaden to Omega Protein scooping them all up for their operations. It is my understanding that this starts near where they operate in Chesapeake Bay, a nursery for menhaden, where young menhaden that haven't had a chance to reproduce, are being scooped up, and then the industrial fishing boats go within three miles of state limits to fish in federal waters along the coast. There needs to be significant management of these operations and limits placed on this company and their boats, so the menhaden have a chance to rebound for their use, for small fishing businesses and for the local wildlife. If not, there will be detrimental effects on the ecosystem and in turn, on the local economy.

I am asking that you cut Chesapeake Bay's industrial harvest cap by at least 50%, spread the allowed harvest more evenly across the season, and make a substantial coastwide total allowable catch reduction for the 2027-2029 fishing years, to give these fish a chance to repopulate.

The wildlife and small businesses around Rockaway, NY depend on this crisis being managed before it's too late.

Thank you for your time.

Best,
Katelyn McFadden

ASMFC,

Menhaden is shared resource, and should be shared by all.

What happens in the Chesapeake Bay affects the entire coast. The Bay is the largest estuary on the Atlantic coast, and many fish begin their lives there, especially the striped bass.

I want to go on record that I support addendum 2 and support option B4, with a 50 percent reduction to 25,500 metric tons.
Please do not link the Bay Cap to the Coastwide TAC.
I oppose option C,
I support option B1, and
I support option B, revisiting the cap every three years.

Thank you for your time,

Robert McDowell
NY Sport Fisherman

Categories: Menhaden 2 Auto Replied

To Whom it May Concern,

I am a biologist who has been following the Omega Protein story for nearly a decade. What used to be a local crisis in the Chesapeake Bay area has recently spread throughout the Atlantic coast up to Connecticut. Ospreys had begun to make a comeback along the Atlantic coast, but this season was one of the worst ever. In my former home by Jamaica Bay, NY, where I was raised, only 5 chicks survived the entire season because of lack of food, and 20 nests were abandoned. A few years ago I would see triple the amount of young Ospreys on some days, and this year only 5 survived in the entire region.

We know the major reason for this dramatic decline. It is the same culprit that decimated the Chesapeake Bay ecosystem several years ago. Omega Proteins have overfished the Atlantic coast to the point where the ecosystem from Virginia up to Connecticut has been impacted at unprecedented levels. Omega Proteins is a large corporation that spends massive amounts of money on lobbyists that feign innocence in the face of enormous amounts of evidence presented against them by independent scientists working tirelessly around the clock to protect the wildlife they love and their habitat. Please side with the people, the Ospreys, the environmental scientists & biologists, and the environment that supports them and us humans as we battle the effects of climate change. The catch limit must be reduced by at least 50% for there to be any chance for recovery. That is the bare minimum.

After what we have seen this summer, allowing Omega Proteins to continue to deplete the menhaden from the Atlantic coast at the rate they have done will cause irreparable effects long term that will destroy the ecosystem that not only protects wildlife but protects coastal citizens from effects of climate change. We need a healthy coastline, and the loss of vulnerable Ospreys are the proverbial canary in the coal mine. Please vote for what is right and protect our country's coast!

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear ASMFC Atlantic Menhaden Management Board,

I support stronger restrictions on Atlantic menhaden harvest in Draft Addendum II. I favor reducing the Chesapeake Bay Reduction Fishery Cap by 50%, from 51,000 metric tons to 25,500 metric tons, and I support spreading reduction harvest across quota periods so it is not concentrated in ecologically sensitive parts of the season. Menhaden are a foundational forage fish for striped bass, bluefish, ospreys, and the broader coastal ecosystem; management should err on the side of leaving more forage in the water. I also support revisiting the Bay Cap at least every three years as Bay-specific science improves.

Thank you for considering this comment.

To whom it may concern,

I'm aware of the proposal to cut Chesapeake Bay menhaden harvesting by 50%. As a fishing charter captain out of the Long Island Sound in NY, the passing of this proposal is vital to my career and those of every northeast charter company/captain.
Cutting the harvesting capacity would foster a rebound in a struggling fish species that feeds the entire northeast's marine life. Whales, game fish, sharks, seals, birds, whales, almost everything consumes bunker, as us Long Islanders call them.
A lot of other fisherman are saying they are doing well catching large striped bass, but that juvenile striped bass are essentially nonexistent. What does this say about the future of the fishery? Large bass are not breeding because they are also heavily fished and they are not able to consume the bunker they need in the Chesapeake. Soon, once the larger stripers pass away, there will be none left.
No bunker means a decimated marine ecosystem and would probe similarly disastrous to the economies of the entire coastal northeast as charter fisherman like myself take people out to catch fish that menhaden eat, then those people go to shops and restaurants in these towns.
The passage of this proposal is incredibly important and must be done. Please.

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

I am writing from the Connecticut River Estuary, where the Osprey, the magnificent fishing hawk, resides and raises its young.
Ospreys were nearly eliminated in the 1950's and 60's by the wholesale use of the pesticide DDT. That tragedy was avoided by the banning of DDT and the ospreys recovered, along with our national bird, the Bald Eagle.
But now the osprey is again threatened with severe reduction and possible elimination from the North Atlantic Coast. This time from food shortage and the starvation of newly born ospreys. The culprit in this scenario seems to be the over fishing of the osprey's primary prey, the menhaden. This high- calorie fish is essential for the feeding of young birds.
I urge the Commission to take immediate steps towards the adoption of regulations that will return the Menhaden to historic levels so that the Osprey can once again thrive along our shores.
Thank you.
Regards,
Evan Griswold
Old Lyme, Connecticut

Subject: [External] Atlantic Menhaden Draft Addendum II, Protect Menhaden

Categories: Menhaden 2 Auto Replied

Dear Atlantic States Marine Fisheries Commission (ASMFC),

The Chesapeake Bay osprey population is experiencing an unprecedented reproductive crisis driven by severe food stress, with population sustainability falling below the historic lows seen during the DDT era of the 1960s and 1970s. Researchers are finding an increasingly alarming number of starving chicks unable to survive their first few weeks, and nutritional deprivation is so severe that a substantial portion of female ospreys are failing to lay eggs entirely. In fact, in some areas 74 percent of the pairs nesting failed to produce any young. Current reproduction rates have plummeted far below levels to sustain osprey with an expected decline of 14% of the osprey population annually.
I support the long overdue restrictions on menhaden proposed in Addendum II of Amendment 3 to the Interstate Fishery Management Plan for Atlantic Menhaden. I specifically support the following proposed limits and would further support a complete menhaden fishing moratorium should that be considered:

- 3.1 Chesapeake Bay Reduction Fishery Cap Amount: Support option C1e that would Reduce the Bay Cap by 50 percent and limit it to 13.6 percent of the Coastwide Catch Limit (TAC) and also support option C2a which sets an upper limit of 51,000mt for the Bay Cap, which is the current level.
- 3.2 Chesapeake Bay Cap Distribution: Support option B2 which establishes three even length quota periods for the Bay Cap, but distributes harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. We support option B which establishes quota period overage payback and rollover of unused quota within a fishing year.
- 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: Support option B Revisit Provision to reassess the efficacy of these new management tools every 3 years.
We have waited far too long to act to protect menhaden which are critical to ospreys and many other species of Chesapeake Bay wildlife.

Sincerely,

Carol Appleby

Subject: [External] Atlantic Menhaden Draft Addendum II – Public Comment – Debbie Campbell
Attachments: ASMFC_Draft_Addendum_II_Debbie_Campbell_Email_Final.pdf

Categories: Menhaden 2 Auto Replied

Please accept the attached document as my formal written public comment on **Atlantic Menhaden Draft Addendum II** for consideration by the ASMFC Atlantic Menhaden Management Board.

I respectfully request that **my full attached public comment be distributed to all members of the Atlantic Menhaden Management Board for their review and consideration and that the document be included in its entirety in the official public record for Draft Addendum II and the associated public hearing process.**

I strongly support the **most protective alternatives available under Draft Addendum II**, including the maximum **50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons**. I also support measures that reduce concentrated harvest during ecologically important periods and prevent future increases in the coastwide TAC from automatically increasing industrial fishing pressure within Chesapeake Bay.

My interest in this issue is both personal and longstanding. I am a **Maryland property owner and a Bay-adjacent property owner in Northampton County, Virginia**. I am also the **Editor and a founder of *Menhaden Little Fish - Big Deal!***, a **member of SMRFO and the Virginia Saltwater Sportfishing Association (VSSA)**, a recreational angler, and a conservation advocate.

As explained in my attached comments, I believe the central issue is not simply whether Atlantic menhaden are healthy coastwide, but whether Chesapeake Bay contains sufficient forage, in the right places and at the right times, to support its predators and broader ecosystem while a concentrated industrial reduction fishery operates within the estuary.

Given the significant remaining Chesapeake-specific scientific uncertainties, I believe precaution is warranted. I therefore urge the Board to adopt the strongest protections available under Draft Addendum II, continue and accelerate Chesapeake-specific research, and treat these measures as an **interim step toward ultimately moving the industrial reduction fishery out of Virginia state waters**.

Please confirm receipt of this email and the attached document and, if possible, confirm that the complete document will be distributed to the Board and preserved in its entirety as part of the public record.

Thank you for your assistance and for ensuring that my complete comments are available to the members of the Board as they consider Draft Addendum II.

Respectfully,

Debbie Campbell
Editor and a Founder, *Menhaden Little Fish - Big Deal!*

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):

I am writing as a Maryland resident who has lived in St. Mary's County since 2015 and has developed a deep personal connection to the Chesapeake Bay. I am a waterfront resident and someone who spends considerable time on and around the Bay. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base.

I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.

The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - **menhaden.**

Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. **Where and when the fish are removed matters.**

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.

I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.

For that reason, I urge the Commission to establish **strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months**. Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coastwide fishery.

There is also an important management issue that deserves attention. The Commission's coastwide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.

I respectfully urge the Commission to:

1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.

2. Establish firm seasonal quota periods for menhaden.

3. **Prevent excessive concentration of reduction harvest during the summer months.

4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.

5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.

I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting.

The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake Bay users and stewards.

Sincerely,

Falōin Williams

St. Mary’s County, Maryland

To whom this may concern,

Reduce the coast wide total catch by 40%. Local menhaden need support and this would allow them to rebound from overfishing.

Thank you for taking the time to read.

Dear Mr. Boyle:

We strongly support a 50% reduction in the Chesapeake Bay reduction fishery cap (Option B4/ reducing the cap to 25,500 metric tons) and support seasonal quota periods!

We have lived along the Magothy River for almost 50 years and have been boating in the river and the Bay just as long. We care deeply for the Bay ecosystem and all of the creatures that call it home.
We have grave concerns about the declining productivity and widespread nest failures among our osprey population. Together with the stressed populations of striped bass, these declines signal an URGENT need for precautionary conservation practices NOW.
Industrial reduction fishing extracts over 100 million pounds of fish in a concentrated summer window, harming the local food web and depriving other groups, especially watermen and anglers, of fair access. We urge fishery managers to implement strict quota periods that will distribute the harvest evenly across the year rather than allowing an intense summer harvest.

Thank you for being a responsible steward of the entire Bay ecosystem before it is too late!

Robert & Karen Royer

Hi!

Please save the ospray!

3.1 Chesapeake Bay Reduction Fishery Cap Amount

"Option C1e: To reduce the Chesapeake Bay CAP by at least 50 percent in 2027 and link any changes to the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).

Option C2a: To set the maximum upper limit in any future change at the current level of 51,000mt.

3.2 Chesapeake Bay Cap Distribution

Option B2: To establish three even length quota periods for the Chesapeake Bay Cap, distributing the harvest at 25% in period 1, 25% in period 2, and 50% in period 3.

Option B: Provides any underage of Quota Periods 1 or 2 be rolled into Period 3 of the same fishing year. Any underage in Quota Period 3 would not be reallocated. Any overages would be deducted from the same quota period in the following year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision

Option B: Revisit the Chesapeake Bay Cap every 3 years

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Categories: Menhaden 2 Auto Replied

I support the following selected alternatives for the Chesapeake Bay Cap, as ecologically and socioeconomically appropriate, to inform effective management actions, reduce the risk of overfishing, and promote resilient futures for the resource and its communities.

- 3.1 Chesapeake Bay Reduction Amount
  - : Sub Option B4 – a 50% reduction in the current Bay Cap, resulting in a Bay Cap of 25,500 mt.

- 3.2.1. Chesapeake Bay Reduction Fishery Cap Quota Period
  - : Option B1 – Even Length & Even Harvest.

- 3.2.2 Chesapeake Bay Reduction Fishery Cap Quota Period Overages and Underages
  - : Underage Sub Option 1 – an underage in Quota Period 1 would be split evenly and rolled over to Quota Periods 2 and 3.

- 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision
  - : Option B – The Chesapeake Bay Cap will be reviewed at least once every three years.

The coastwide TAC must be reduced by at least 30%, from the current 186,840mt to 130,788 mt. Ideally, the coastwide TAC should be reduced by 50%, lowering the operating TAC to 94,420 mt. These are the only options to ensure the coastwide commercial Atlantic Menhaden fishery operates at a capacity that does not carry a 100% probability of overfishing.

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear ASMFC members,

I am writing to comment on the management of Menhaden harvesting in the Chesapeake Bay. I am strongly in favor of a significant reduction, of at least 50% of the current level, of the Menhaden harvested in the Bay.

As you are aware, reproduction of Osprey in the southern, more saline, portions of the Chesapeake Bay have dropped dramatically in the last few years. Studies indicate that about 30% of adult female Osprey are not breeding at all, and in many nests, Osprey chicks are starving to death. This year's nesting success rate was the worst ever recorded, with a reproduction rate lower than during years when DDT devastated raptor reproduction. Since the rebound of Osprey numbers after the banning of DDT, the Chesapeake Bay has been a stronghold of Osprey along the Atlantic Coast. With the current reproductive rate, the Bay will lose that distinction, and the number of Osprey along the coast will decline significantly.

Although the underlying cause of this decline has not been absolutely proven, a significant reduction in the Osprey's main diet item in the lower Bay, Menhaden, appears to be the culprit. The reproduction rate of Osprey in the fresher portions of the Bay, where they feed on a variety of fish species, has not seen such significant declines. One company, Omega Protein, based in Virginia waters, is responsible for the vast majority of Menhaden harvested in the Bay, 70% of the Menhaden harvested on the Atlantic Coast. The Menhaden caught are rendered to fish meal used in animal feed and for nutritional supplements.

Just like the Canary in the coal mine, Osprey serve as an important indicator species, and the Osprey nest failures are a sign of a broader ecological disruption. The lower Chesapeake Bay is a vital nursery for Menhaden along the Atlantic Coast. And Menhaden, are an important food source for a variety of species in addition to Osprey, including seabirds, dolphins, sharks and other large fish, such as Rockfish, Weakfish and Bluefish. Sports fishermen, particularly those fishing for Rockfish, are also calling for stricter regulations for Menhaden harvesting.

I agree with a number of environmental organizations such as the Chesapeake Bay Foundation, the American Bird Conservancy and National Audubon Society, that we need much stricter regulations

regarding the harvest of Menhaden, at least a 50% reduction. A complete closure of all harvest for rendering in the Bay would be even better. We need a more accurate management system that ties harvest limits to coastwide management and adapts as new scientific data becomes available.

Thank you for this opportunity to express my opinion on this important issue. With such a dramatic decline in Osprey populations, we can't afford to wait to make a significant reduction in the harvesting of Menhaden in the Chesapeake Bay.

Sincerely,

Ellen M. Lawler

Subject: [External] Atlantic Menhaden Draft Addendum III

Categories: Menhaden 2 Auto Replied

To Whom it May Concern:

I am writing to express my strong support for a 50% reduction in the Chesapeake Bay Reduction Fishery Cap (Option B4/ reducing the cap to 25,500 metric tons). I support seasonal quota periods as this just makes good ecological sense. As a concerned citizen who lives within the Chesapeake Bay watershed, I am concerned about the environmental and economic health of this large important body of water.

If we consider the osprey as an indicator of the health of the Bay, then we are failing miserably. The last several years have seen declining productivity and widespread nest failures. Industrial reduction fishing extracts over 100 million pounds of fish in a concentrated period over the summer. The removal of fish harms the food web and those species dependent on this food source. This reduction in fish also deprives watermen, anglers, and coast tourism economies of fair access.

Please support implementation of strict quota periods that distribute harvest evenly across the year rather than allowing an intense summer harvest. It's in the best interest of all species.
Sincerely yours,
Hedy Cohen

ASMFC,

My name is captain Charles Horton, and I'm a veteran, outdoorsman and lifetime resident of the Chesapeake Bay. Since I began fishing the bay in the mid 90s, there has been an obvious decline in both the amount of menhaden in the bay as well as the bay's overall health. I have personally witnessed Omega Protein break numerous laws while harvesting menhaden as well as thousands of gamefish killed as by catch by the mehaden reduction fishery. The catch limit for menhaden must be reduced and greater restrictions placed on the fishery to preserve the health of the bay.

I am writing as an aquatic biologist who has studied the menhaden issue to encourage the most protective management options for menhaden. Specifically, I strongly urge the Commission to select Option B4 to implement a 50% reduction in the Chesapeake Bay reduction fishery cap, lowering it to 25,000 metric tons. I also fully support establishing seasonal quota periods to eliminate the severe, concentrated industrial harvest that occurs during critical wildlife breeding season.

Thank you for your time and dedication to protecting our shared marine resources.

Sincerely,
Sally Hornor, Ph.D

Raymond H. Norris & Carla K. Norris

18152 River Road

Tall Timbers, MD 20690

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):

I strongly support reducing the Chesapeake Bay reduction-fishery cap by 50 percent—from 51,000 metric tons to 25,500 metric tons per year—and establishing strict seasonal quota periods for menhaden. The Chesapeake Bay is too important, and the ecological warning signs are too serious, to continue managing this critical forage fish as though the timing and location of harvest do not matter. Our family has lived on the Potomac River in St. Mary's County MD since 1977 and have observed first hand the decline in the overall fish population and most recently the marked absence of our annual ospreys, by which we mark our calendars, March 15th, for their return each year! Until this year!! The evidence points to a decline in the number of menhaden that the ospreys, striped bass and other marine life in the Chesapeake watershed depend upon for their survival. It is both when and where those fish are removed that matter. A menhaden harvested from a concentrated school in the Bay during the summer is no longer available to the predators that depend upon that school. Concentrated removal can create localized depletion during a biologically important period and can affect the availability of forage to other users of this shared public resource. The consequences extend beyond the reduction fishery. Menhaden support the Bay's recreational fishing economy, commercial and charter fishermen, watermen, wildlife, and coastal tourism. One user group should not be permitted to concentrate an enormous harvest of a shared forage resource during the period when that resource is most important to the rest of the ecosystem and to other Bay users. For that reason, I urge the Commission to take the following actions: • Reduce the Chesapeake Bay reduction-fishery cap by 50 percent to 25,500 metric tons annually. • Establish strict seasonal quota periods that distribute harvest throughout the year rather than permitting an intense summer harvest. • Apply a precautionary management approach in light of uncertainty regarding localized menhaden abundance and the ecological condition of the Chesapeake Bay. • Give greater consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the broader Chesapeake Bay economy, not just one Virginia based fishing company. The Chesapeake Bay is not simply a location on a fisheries management map. It is a complex and interconnected ecosystem, and menhaden are one of its essential links. We should not wait for further deterioration before

taking action. There is no time for additional five-year studies to delay the decision. The severe drop in nesting pairs and the lack of surviving chicks will not replenish the species enough to survive that long. As someone who lives here, fishes and sails these waters, swims in them, and cares deeply about the wildlife that depends upon them, I believe the Commission has an obligation to manage menhaden conservatively and to recognize that the health of the Bay must take precedence over maximizing a concentrated industrial harvest. Reduce the cap. Establish meaningful seasonal quotas. Protect the forage base. Give the Chesapeake Bay—and the people and wildlife that depend upon it—a greater margin for recovery.

Thank you for your consideration.

While this is a partial copy of another concerned citizen's letter, it in NO WAY diminishes the sentiment expressed by us, The Norris Family of Tall Timbers, MD !!! 2 of our sons and their families live in Tall Timbers on the Potomac. We want our grandchildren to be able to enjoy our waterways and to be good steward to these waters as we have tried to be. Please take the appropriate action for us and for future generations!!!!

Sincerely,

Raymond H. Norris

Categories: Menhaden 2 Auto Replied

Folks at ASMFC, thanks for all you do. I know you are taking public comment on your management plan for menhaden. Here are the options I think you should adopt:

- Reducing the initial Chesapeake Bay Cap by **50%, from 51,000 to 25,500 metric tons**. 3.1 C1e
- Establishing the Bay Cap at **13.6% of the coastwide total allowable catch** so it can adjust when the coastwide quota changes. 3.1 C1e
- Maintaining **51,000 metric tons as the maximum Bay Cap**, with no fixed lower limit. 3.1 C2a
- Allocating **25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period**. 3.2 B2
- Requiring early-season quota-period overages to be deducted from the corresponding period during the following year. 3.2 B
- Requiring ASMFC to revisit the Chesapeake Bay Cap and related management measures every three years.
    - 3.3 B In addition to these options, I believe Virginia should have a 3 mile limit on reduction fishing as does every other state on the Atlantic seaboard.

Thank you for considering my opinion,
Robert Lawrence

Subject: [External] Comments for Menhaden: Addendum II

Categories: Menhaden 2 Auto Replied

It is well known, though the Atlantic Menhaden is not considered to be a game fish, but is a very important species for both the health of the water system (being filter feeders that help to control includes zooplankton, several species of phytoplankton including *Pfiesteria*, as well as suspended organic plant detritus and algae blooms) and as a feed source for fish further up the food chain, stricter harvest limits must be established.

Taking the NOAA reported metric tonnage over a 66 year history covering 1950 thru 2006 for the Atlantic Menhaden and breaking this information down into different categories, trends did develop. It was noted that as the years progressed the Gulf total tonnage was starting to mimic the Total Metric Tonnage Landings (this trend starts approximately in1966); The Atlantic catch was diminishing and starting to follow the trend and mirror the Chesapeake landings (this trend is most noticeable starting in1983). Today, the total catch is set at a much lower amount than what was the total catch of 2006 without a real gain in the estimated population.

For these reasons I support under 3.2 Chesapeake Bay Cap Distribution 3.2.1. Quota Periods Option B1 without a carrying forward of the unmet percent harvest to the next period, but with the subtraction of overages from the next period.

Under 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision I support Option B,tThe Chesapeake Bay Cap will be revisited every three years or more often following implementation of this draft addendum

One other thing to consider that due to the high concentration of netting just east of the Chesapeake Bay Bridge, this boundary be redefined as of at least 5 miles east of the Chesapeake Bay Bridge.

Thank you for your time concerning this matter.

Subject: [External] Atlantic Menhaden Draft Addendum

Good afternoon,

As someone who works on the water and appreciates nature, I have been deeply disturbed by state of our Menhaden population. These fish are a keystone species to the saltwater ecosystem and their lack of abundance has clearly proven that.
Over the years I've personally witnessed a drop in fish stocks such as striped bass and struggles for our marine mammals like whales and dolphins. Ultimately diminished Menhaden stocks have proven to be the common factor for these issues.

I ask as a person who loves our marine ecosystems that Menhaden harvest in the Chesapeake be reduced by the full 50% being proposed. In addition, bay harvest caps must be linked to costal catch limits. Finally I ask that bay harvest be spread across quota periods to stop the bay from being stripped of this major food source during the spring and summer months

Thank you for your time and consideration.

Respectfully,
Dave I. de Cesare

It is clear that the dramatic decline in Osprey population is a result of *overfishing of menhaden*. Please take action to reduce this overfishing. I am a retired commercial fisherman myself and the overfishing of menhaden has crushed the rockfish population as well as causing the serious decline of osprey, for which I have provided a nesting post for many years. Taking vast quantities of menhaden for fertilizer is an environmental evil. Please do the right thing.

Categories: Menhaden 2 Auto Replied

It is no secret that the huge decline in osprey and striped bass populations in Maryland & Virginia are due to the lack of nourishment derived from their feeding on menhaden fish that were once plentiful in the Chesapeake Bay. Osprey chicks are literally starving to death because their parents cannot find enough menhaden fish to feed them. Very few offspring survived this year's brood. Allowing foreign countries to profit from the Bay's bounty by circumventing U.S. laws should not be tolerated. Canadian Company, Cooke, Inc. owns Omega Protein who obtains U.S. registration for the aircraft and boats used in the netting of menhaden in Maryland & Virginia waters . They hire American labor to carry out the heist. They enter the bay with their school spotting aircraft and their boats deploy 6-mile-long nets capable of taking an entire school of menhaden at one time. I strongly believe that a moratorium on the taking of the menhaden fish from the Chesapeake Bay in this manner should be in place for no less than 3 years. Hopefully this will be enough time for both species to recover and thus help out the local waterman and recreational fishing industries that are currently at a low ebb. The only argument that favors the current practice is that a handful of watermen from Reedville, Va. will be out of work. The U.S. government has provided for such cases when trades become obsolete. These workers will be eligible to participate in the TRADE ADJUSTMENT ASSISTANCE PROGRAM. The program not only teaches workers new trades, but it assures that money is available for them to live on while they make a career change to a more viable profession.

Categories: Menhaden 2 Auto Replied

I have observed the Chesapeake Bay closely for 74 years in the vicinity of Edgewater, MD. The degradation of the Bay over that time has been immense. Continued pressure on the menhaden population by the reduction harvesters will damage the Bay and its aquatic and bird populations unacceptably. Menhaden are essential to the diets of Ospreys and founding fish like striped bass. Both species have unequivocally suffered greatly, as evidenced by unbiased surveys. These iconic Bay and Atlantic coast creatures are being pushed to criticality dangerous levels by excessive and unnecessary reduction harvesting. Harvesters use menhaden for low importance products like animal food, fertilizer, and omega 3 vitamins, among other things. There are many alternative sources for these products that do not critically impair the Ba y and Atlantic. Coastal regulators and governments have made great strides in repairing the oyster population through conservation, artificial reefs and the encouragement of floating oyster farms, among other things. One benefit is the increased and prodigious filtering that oysters provide. Menhaden are also prodigious filter instruments. This fact does not appear to have been considered in the draft addendum. It should be part of the cost-benefit analysis in weighing the proposal. Please view this link to see menhaden filtering the water: https://myfishingcapecod.com/filter-feeding/ Additional harm to osprey and rockfish has been generated by invasive species overtaking the waters, like blue catfish and snakeheads, who have rapid reproduction rates and feed throughout the water column. We do not need another source of great harm to the osprey, rockfish and other Bay creatures through the unnecessary harvesting of menhaden by reduction harvesting which has many other sources for the products they produce that are not harmful to the Chesapeake Bay or the Atlantic coast. In sum, I strongly oppose all reduction harvesting and support the most extreme, conservative options in the draft addendum. It is important to stop the high-tech, mechanized pursuit of menhaden by aircraft and drones. It won't be long before the reduction harvesters start using artificial intelligence to completely decimate the menhaden population. The Chesapeake Bay and the Atlantic coast belong to all of the citizens of the United States and should not be jeopardized to enrich reduction harvesting that has many other sources to manufacture its animal food, fertilizer, and vitamin products. Corporate interests should not prevail over the rights of citizens and the natural order of the waters. With reasonable judgment, objective cost-benefit and economic analysis staunching reduction harvesting, perhaps the Bay will eventually be restored to the levels I recall as a child and adult. The need for reduction harvesting pales in comparison to making the Bay and its animal life healthy again. Please do the right thing. Help preserve this nation's largest estuary that is a critical nursery for East Coast rockfish spawning and osprey nesting. Thank you for your courtesy in considering my comments. If you have any questions, please let me know.

Pls do the right thing and take a balanced approach to the management of this critical resource. Continued over-harvesting dooms Menhaden and the entire food web they support. Do the right thing for the long term, not the short term selfish thing. Protect these fish.

Categories: Menhaden 2 Auto Replied

This is a comment asking for a much reduced allowance of Atlantic Menhaden harvested anywhere on the eastern seaboard. This is also asking for a ban on fishing of young Menhaden.
The Osprey on our eastern coast are failing to thrive, and failing to produce offspring due to the lack of food. People have food alternatives. Other species do not have so many options. The reduction, this summer, of Osprey hatchlings, and of fledgling is alarming. We need to act now to rescue not only the Osprey, but other species which feed on Atlantic Menhaden.

Thank you.
Melene Rose

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

I am writing to encourage you to pass the strongest possible protections for menhaden in the Chesapeake Bay offered in this Addendum. The plight of the osprey in our bay is obvious: the number of hatchlings that are able to be successfully raised by their parents has dramatically decreased in the last 5 years because the osprey cannot catch enough to keep the baby osprey fed. We cannot see the impacts on the aquatic species in the bay, or the species that depend upon them.

These protections look like the best way to give the menhaden to recover, and the re-examination in 3 years will see if this is actually effective.

3.1 Chesapeake Bay Reduction Fishery Cap Amount

I support option C1e: that reduces the CAP by at least 50 percent in 2027 and limits the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).

Also, support option C2a, which sets an upper limit of 51,000mt for the Bay Cap (the current level).

3.2 Chesapeake Bay Cap Distribution

I also support option B2, which establishes three even length quota periods for the Bay Cap, but distributes harvest 25% in period 1, 25% in period 2, and 50% into period 3.

Also, I support, option B, which establishes quota period overage and underage provisions within a fishing year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision

Support Option B to revisit the Bay Cap every 3 years.

The health of the Chesapeake Bay, and of all the communities and species that depend upon it matters immeasurably. You have it in your power to protect the Bay, and to secure not only a tremendous legacy in doing so, but to secure the health of an irreplaceable national ecosystem.

Respectfully,

Linda G. P. Schneider, MD, MBA, FAAFP

Cutting the Chesapeake Bay Cap by the full 50%

Linking the Bay Cap to the coast wide catch limit, so when one drops, the other does too

Spreading Bay harvest across quota periods so the bay isn't stripped in spring and summer

Reducing the coastwide catch limit by 40% to meet the science for 2027 and beyond.

Protect this valuable food fish that so many depend on please!

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

I strongly support the maximum proposed reduction of 50% in the Chesapeake Bay menhaden reduction fishery cap under Draft Addendum II.

I began saltwater fishing in 2017, and since then I have watched the fishing I care about decline. It is frustrating and heartbreaking to see that change in less than a decade. My experience is a personal observation, not a scientific assessment, but it is why I feel strongly that fisheries management needs to take meaningful action now.

Menhaden are essential forage for striped bass and other predators. Management must account for their value alive in the ecosystem, not simply the amount that can be harvested. Protecting the forage base is an investment in healthier fisheries and the coastal communities that depend on them.

I recognize that multiple factors affect the health of our fisheries. That does not diminish the importance of protecting menhaden or justify delaying precautionary action.

Please adopt the full 50% reduction. I want future generations to experience healthy, abundant saltwater fisheries, and I am asking the Board to prioritize that long-term future.

Good evening James and committee. Just writing to let you know I support A 50 percent t cut in the bay cap. Fishing over 3 periods. Please don't reallocate unused quotas to other regions etc….hoping you decide to err on the side of conservation. You can always reassess the effects of these moves in 2 or 3 years. The past few seasons Menhaden have been very scarce up here in Western Long Island Sound. I'm just hoping for the sake of our kids and grandkids we do the right thing . Thanks
Mike Feeney.

Hello guys . Please go with a 39 percent cut in the Tac. For the sake of the Menhaden. And as a Grandparent I'm writing on behalf of my one and only two year old grandsons. I'm hoping they can experience some of the great sights I have seen over the years when the food source for all marine life is abundant. You can do the same for your children and grandchildren by following the science and observations the past few years. Thanks

ASMFC Members,

I am writing to ask you to please preserve the menhaden fishery by implementing a 50% reduction in the Chesapeake Bay Cap.

Though I am from Massachusetts, this issue is having a direct impact on the lives of many of my friends who earn their livings guiding the waters, the local fishing/seafood industry, and my own life as well.

I have lived on the water my whole life and have a passion for saltwater fishing - specifically striper fishing. This summer, my two young sons, aged 7 and 5 finally began to ask me in earnest to take them fishing.

Growing up, I was always enthralled by going down to the rivers on the South Shore that were filled with schoolie stripers to catch and release. They were always there.

Now, finding a school of them is a unique, isolated event. Of all my fishing spots and those that my friends who guide took us to, we caught 0...even in "The Fall Run."

All my boys wanted to do was catch a striper. They kept saying it to me over and over again. For a guy (me) who used to go out and catch them by the dozens over the years of my life, it was a sad reckoning that our amazing resources are disappearing before our eyes.

I know that menhaden are not only bait fish stripers eat, but this problem we are all facing is extremely complex, and the rapidly declining menhaden population is most likely a reason for this. It is also most likely a reason why our entire fishery for all species is in decline.

All I want is for my children, your children, and our children's children to be able to go out and enjoy the experiences that our incredible East Coast holds for them.

In an age where we can all agree there is far too much tv, screen time, and social media, I believe it is our obligation to preserve the things in life that truly matter and bring us together.

Thanks for listening.

- Joe

Subject: [External] Atlantic Menhaden Draft Addendum II -Public Comment - Friday, October 9; 10:00pm

Categories: Menhaden 2 Auto Replied

Members of the Commission,

My name is Deborah Boatright, a 15 year resident of the Bay Creek Community in the town of Cape Charles, and I am CONCERNED!
I am concerned about the continued industrial-scale harvesting of Atlantic menhaden in Virginia's Chesapeake Bay and therefore am writing to urge the Commission to adopt stronger, precautionary measures to protect this vital natural resource.

Menhaden are more than a commercial commodity. They are a foundational species in the Chesapeake Bay ecosystem, providing an essential food source for striped bass, osprey, dolphins, and numerous other fish and wildlife. Maintaining an adequate supply of menhaden is critical to the health of the Bay, the survival of predator species, and the long-term sustainability of the region's fisheries.

As a resident of Northampton County, I am particularly concerned about the concentration of industrial harvesting in the Bay and its potential effects on other fisheries and the broader ecosystem. Although coastwise assessments indicate that Atlantic menhaden are not currently overfished, and overfishing is not occurring, those findings do not necessarily establish that local menhaden availability in the Chesapeake Bay is adequate to meet the needs of predators and other fisheries.

Therefore, I urge the Commission to take the following actions:

1.
Reduce the Chesapeake Bay reduction fishery harvest cap. Adopt a meaningful reduction in the current cap, with serious consideration given to the proposed 50% reduction, as a precautionary step to protect the Bay's ecological balance.
2.
Distribute harvesting more evenly throughout the season. Establish seasonal quota periods to prevent excessive concentrations of industrial harvesting during critical periods for menhaden and the species that depend on them.
3.
Strengthen scientific monitoring and accountability. Improve the collection and analysis of data on local menhaden availability, predator populations, fishing activity, and the effects of industrial harvesting within the Bay.
4.
Protect the long-term interests of the Chesapeake Bay. Ensure that management decisions account not only for the commercial value of harvested menhaden but also for their ecological importance, recreational fisheries, local fishing communities, and the public interest.

The Chesapeake Bay is an invaluable natural resource that deserves responsible, science-informed stewardship. Once ecological damage occurs, restoring the balance can be difficult, costly, and time-consuming. Management decisions should therefore reflect a commitment to prevention, transparency, and long-term sustainability.

I recognize the economic importance of commercial fisheries. However, responsible fisheries management must balance those economic interests with the need to preserve the natural systems that sustain fish populations, wildlife, and fishing opportunities for future generations.

I respectfully urge the Commission to adopt meaningful reductions in industrial menhaden harvesting in the Chesapeake Bay and implement safeguards that protect this essential forage fish and the ecosystem that depends on it.

Thank you for considering my comments and for your responsibility to safeguard Atlantic menhaden and the Chesapeake Bay for present and future generations.

Respectfully submitted,

A Concerned Resident of Cape Charles, Va
Deborah Boatright
Bay Creek Community

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Atlantic States Marine Fisheries Commissioners:

I grew up spending every weekend on my family's fishing boat for full weekends on the Chesapeake Bay. We fished for rockfish, bluefish, hardheads, and sea trout. While we long advocated for conservation measures to ensure the long-term viability of the rockfish, no one knew that there would be other factors at play that would be causing the decline in rockfish decades later.

Now, the lack of menhaden has led to the serious decline in rockfish again. Menhaden used to provide 70% of the rockfish diet in the Chesapeake Bay but the lack of menhaden caused a reduction to 8% of the adult rockfish diet. Some rockfish caught on hook and line are emaciated from the lack of prey, especially menhaden.

I have lived on Oyster Creek just off the Chesapeake Bay for the last 29 years and look forward every March to hearing the distinct sound of the return of the osprey and then miss them when they begin their journey south in September. We have an osprey nest in clear view from our bedroom and deck. As a photographer and naturalist, I have observed first hand the change in the mating and nesting behavior of our ospreys. For the second year in a row, the ospreys failed to produce and raise young; this is widespread in our part of the Bay. It is obvious that management efforts need to be strengthened.

There is compelling evidence that the overharvest of menhaden is adversely affecting the critical availability of menhaden in the Chesapeake Bay food chain and the Bay's proper ecological functioning. Why should Virginia be allowed to have 75% of all menhaden harvest and to allow Omega Protein to take 90% of that? This is absurd.

All other reduction facilities along the East coast have been closed and no other state allows the purse seining operations employed for Omega Protein's reduction facility. Maryland has banned such harvest methods for more than 50 years. This reduction plant is a relic of the bad old days of unregulated harvest.

I join many others in urging the ASMFC to:
1. Close the reduction fishery until the 2-year Chesapeake menhaden stock assessment and study of the harvest impacts is completed.

2. If this is not done, I urge that the menhaden Total Allowable Catch (TAC) be reduced by 39% from 186,840 mt to no more than 114,200 metric tons as mentioned by the Menhaden Fishery Management Technical Committee. They found that scientific estimates require a reduction to 114,200 metric tons to achieve a 50/50 probability of staying under the ecological fishing target for rockfish. It would be best to reduce the TAC to 100,000 mt to raise the likelihood of helping striped bass recover.

3. As to Addendum II to the Fishery Management Plan for Atlantic Menhaden, I join with many the Chesapeake Bay Foundation, Maryland League of Conservation Voters, Maryland Ornithological Society, the 29 Maryland legislators, and many other conservationists and fishing groups in supporting these changes:

a. Under Section 3.1, Chesapeake Bay Reduction Fishery Cap Amount, adopt Option C1e, which would set the Bay CAP at 13.6% of the coastwide total allowable catch (a 50% reduction under the current TAC), and Option C2a, which would keep an upper limit of 51,000 metric tons for the Bay CAP.

b. Under Section 3.2, Chesapeake Bay CAP Distribution, adopt Option B2, which would establish three even-length quota periods and distribute harvest 25% in period one, 25% in period two, and 50% in period three, and Option B, which would establish quota-period overage payback and rollover of unused quota within a fishing year.

c. Under Section 3.3, Chesapeake Bay Reduction Fishery CAP Revisit Provision. Adopt Option B, which would require the Board to reassess the efficacy of these management tools every three years.

There are compelling indications that the overharvest of menhaden is adversely affecting the critical importance to the availability of menhaden in the Chesapeake Bay food chain and the Bay's proper ecological functioning. This compounds decades of massive removal of menhaden for the reduction fishery where menhaden are now taken to be processed into fish meal and fish oil to profit a Canadian corporation, Cooke, Inc. This deprives other fish species dependent on menhaden as a forage fish of important protein and fat resources that are of ASMFC conservation concern.

Osprey reproductive success is crashing as evidenced by Dr. Bryan Watts of Virginia's William and Mary Center for Conservation Biology.

Finally, menhaden support a working fishery in Maryland, mainly by pound netters. Our watermen harvest menhaden, and our crabbers rely on them for bait. Menhaden are not making it to Maryland waters like they once did. Since 2017, Maryland has been unable to harvest even half of its small quota. In 2024, Maryland harvested less than 10% of its TAC menhaden quota of 1.17%. This fishery has declined sharply as menhaden harvest dropped by more than 80% since 2020 and still is below 10% of the TAC quota.

Menhaden fishers in Maryland simply cannot find enough menhaden to make economic sense. This leaves crabbers, our main fishery, struggling to find affordable bait as menhaden harvesters are unable to participate in the fishery. The Potomac River Fishery Commission (PRFC) 2025 Commercial Finfish Report documents a radical decline of pound net bait harvest in the Potomac, crashing to 169,423 pounds in 2025 down to 2.4% of the 1964-2025 average and 8.2% of the 2024 take of 2 million pounds. In 1983, 20.8 million pounds were harvested. See this data at: https://www.prfc.us/pdfs/2026/2025finfish.pdf.

It is well past time for the ADMFC to stop allowing Omega Protein to dictate menhaden policy and step up and substantially curb the harvest for the reduction fishery. Jobs saved in Reedville cost jobs in Maryland fisheries.

Sincerely,

Carol L. Swan
Annapolis, MD 21403

The osprey population in the Chesapeake Bay area has been declining for some time and faces an existential crisis. Many osprey nests have been failing in recent years and several scientists and naturalists have seen an alarming number of osprey chicks essentially starving to death, due to a serious decline in their vital food resource, menhaden fish. The cause of the menhaden decline has been attributed to mass-scale commercial fishing using large, destructive purse seine nets. In view of the size of the annual commercial menhaden catch, I support the proposal to reduce the size of the annual catch by 50% and to distribute the Fishery Bay Cap more evenly throughout the fishing season.

Categories: Menhaden 2 Auto Replied

I'm a retired faculty member from the School of Business at VCU. Sixteen years ago we moved to Meachem Creek, just off the Rappahannock River at the mouth of the Chesapeake Bay. Our attraction to this area was being able to enjoy the abundance of wildlife on the creek. We saw many birds ---osprey, eagles, even pelicans. Fish jumping...even the occasional river otter.

I believe that menhaden have been overfished by commercial fisheries and that this is affecting the food chain in ways that we can see and ways we cannot see.

I hope someone has the power to restore the health of our river and the Chesapeake Bay before it's too late.

Dear ASMFC,

Regarding the Atlantic Coast Menhaden:

I ask that you apply a moratorium to Chesapeake and Delaware Bay catches of Menhaden. If you cannot do this, please apply the most restrictive addendums possible to preserve the Menhaden populations in the Chesapeake and Delaware Bays.

Overfishing has diminished the catch in the Chesapeake and Delaware Bays and tributary rivers as evidenced by fishermen's lack of significant catches, diminished predator specie numbers in these waters and increased mortality of Osprey and their young.

The time to act is now. Please fulfill your obligation to protect sustainable Atlantic Coast Menhaden populations. Your actions now will have consequences for generations to come; not only for Menhaden but for the livelihoods of local residents.

Respectfully yours,

Hello,
My name is Emily Malfitano and I am a concerned mother in New Jersey. Our local fisheries rely on a healthy ecosystem, and a lack of menhaden affects all of us.

In order to protect our suffering wildlife, and more importantly, ourselves, I am in full support of a moratorium of menhaden fishing, followed by a 50% cap reduction.

Please do right by ocean communities and place a moratorium on menhaden fishing, followed by a 50% cap reduction.

Thank you,
Emily Malfitano

This is obviously a crisis of major proportion and has been for many years.The commercial catch of menhaden should be prohibited immediately and the reduction facility in Reedville should be permanently closed. Look at what happened in New Jersey shortly after the menhaden catch was reduced/eliminated-- the catch of striped bass and other fish in the tidal waters increased shortly thereafter.
A recreational fishing guide that I've fished with in the Bay and its tributaries for 25 years closed his business in July, 2026 due to the fishery depletion.
It's way past time to stop talking about this problem and do something now.

Categories: Menhaden 2 Auto Replied

As a resident of the Chesapeake Bay region, I understand that the total menhaden population, a keystone species for the ecosystem of the bay, has likely been significantly overestimated (35-40%), and their numbers have actually been declining at quite an alarming rate. The upcoming studies that have been granted funding are great, but I fear the fish cannot wait for studies to be completed since they have been put off for far too long. In fact, I'm not sure why a temporary moratorium isn't on the table.

Additionally, I have seen many osprey nests fail in recent years and I understand that the population in the bay area has fallen below the point of sustainability. This is heartbreaking to see after witnessing their recovery since the elimination of DDT. Scientists and naturalists that I know personally are seeing an alarming number of osprey chicks simply starving to death. Since the birds rely on menhaden, it is long past time to reduce the annual catch to help reverse this troubling trend.

The birds and local fishermen simply cannot compete with mass scale commercial fishing using large destructive purse seine nets, which is another reason to limit the scale of the catch. Therefore, I support the proposal to reduce the annual catch by 50% and also support the 25%/25%/50% spread to push a higher percentage of the catch beyond the osprey nesting period.

Thank you for your consideration!

Subject: [External] Public Comment on Draft Addendum II

Chair Joseph Cimino
Vice Chair Nicole Lengyel Costa
Members of the Atlantic Menhaden Management Board
Atlantic States Marine Fisheries Commission
1050 North Highland Street, Suite 200 A-N
Arlington, VA 22201

Re: Public Comment on Draft Addendum II

Dear Chair Cimino, Vice Chair Lengyel Costa, and Members of the Atlantic Menhaden Management Board:

In her 1962 book *Silent Spring*, Rachel Carson eloquently warned of the alarming impact of DDT on the survival rate of birds such as the American eagle.

This time, the canary in the coal mine is the osprey. Mother birds sit on nests with starving chicks, waiting for their mates, who are desperately hunting for menhaden to bring back from the sea.

Tragically, this will not happen. This alarming shortage of food for the osprey is directly linked to the shocking decrease in menhaden, a.k.a. bunker.

In the 2007 book, *The Most Important Fish in the Sea*, H. Bruce Franklin maintained that menhaden are the most essential fish on the planet. Ospreys would agree, since menhaden serve as their foundational food source.

The Atlantic States Marine Fisheries Commission is now holding the fate of the osprey in its hands.

In just my small town of Barnegat Light, N.J., there were 12 active osprey nests this year, of which only three produced young. A third of them had adult females who did not lay eggs in the spring due to scarcity of Atlantic menhaden in the ocean. All other nests were active with eggs or young and lost them to food stress and starvation.

I urge the ASMFC to adopt the strongest conservation option under Draft Addendum II: a 50% reduction in the Chesapeake Bay reduction fishery cap, along with measures that distribute harvest more evenly throughout the season and reduce the concentration of harvest during spring and summer.

The ospreys are warning us about an alarming situation. Are we listening? What critically needed action will be taken? Or will the cry of the dying birds be ignored and followed by a Silent Summer?

Dorothy (Dottie) Reynolds

Councilwoman, Borough of Barnegat Light

Subject: [External] Public Comment: Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

I am writing to urge the Atlantic States Marine Fisheries Commission to take immediate, strong action to protect the Chesapeake Bay ecosystem by implementing strict catch limits under Atlantic Menhaden Draft Addendum II. Specifically, I support options that substantially lower the reduction fishing allowance in the Bay.

On my property located at 1737 Harbor Dr in Chester we installed an Osprey nest mounted on a pole(2005)/piling(2013) off the property as permitted by the MDE. From the original years nest until just several years ago we have enjoyed watching these beautiful birds build nests and raise as many as 3 fledglings each year. Something began to change in the past few years. In 2021 we had 3 young fledge. Starting in 2022 we began to see nest built, mating and what appeared to be sitting on eggs only to mysteriously abandon the nest approximately 2 weeks after hatching. The pattern continued in 2023 the female seemed to abandon actual babies after two weeks. Since then we have had pairs arrive at the nest, mate, even add building materials to nest but never finish the process or pattern we had seen in the years from 2000 thru 2020. Not only our pole but the many others on Cox Creek are empty of birds. Something is wrong!

As a resident/supporter of the Chesapeake Bay region, I am deeply alarmed by the unprecedented breeding failures and starvation currently devastating our local osprey populations. Decades of scientific monitoring show a direct link between the lack of mature Atlantic menhaden and the inability of ospreys to successfully raise their chicks.

Menhaden are the ecological backbone of the Chesapeake Bay. Allowing industrial-scale reduction fishing to deplete this critical forage fish at the expense of ospreys, striped bass, and other native wildlife is unsustainable and unacceptable.

Please prioritize the long-term health of the Bay's ecosystem over short-term commercial harvest by implementing the maximum possible protections in Draft Addendum II. Thank you for your time and consideration of these comments.

William & Donna Cox

My name is James Clemons . I've held a lobster license since 1963 , have 3 adult sons with family that are also full time lobstermen, and grandson that has his commercial license with a 33' lobster boat. I'm a member of a Maine lobstering family. I also pogie fish and 2 of my sons also have their commercial menhaden license . We are a small scale independent fishermen. We believe that the existing allocation for Maine is grossly too little. My son's ad I catch our own bait and sell the rest to local commercial lobster wharfs. We fish out of Harpswell, and in this town we have over 450 licensed lobstermen . Bait is very limited ,and the menhaden harvest is vital to our lobster fishery . We need more quota for our state. We have the fish stock here, but with this limited quota we are forced to stay home and not catch the fish . The need is here , the fish archer, the fishermen are here , but the large quotas are down in the southern states. 6000 + lobstermen rely on this limited quota , it's just not fair. Protect Maines lobster industry and grant us a lot more quota . Sincerely, James Clemons

Categories: Menhaden 2 Auto Replied

Hello,

My name is Taylor Ingraham. I am a life-long angler from Connecticut. My family has property in Rhode Island and I have fished up and down the east coast my entire life. I am a father of four boys.

Healthy fisheries are a priority for me, as each of my sons love fishing as much as I did as a kid and as much as I do now. There is urgent action needed for so many species, but today I am commenting on Draft Addendum II.

I urge the Board to cut the Chesapeake Bay Reduction Fishery Cap by 50% to 25,500 metric tons. I reject any effort to link the Chesapeake Bay cap and the Coastwide TAC. Not only are there not enough details about what that would mean, these two areas, while linked, move separately, and there should not be increases in the Bay in the future if there are increases on the coast. These should remain separate.

I believe option B1 for quota periods is the best, and that quota should be spread evenly throughout the year and not focused on certain times.

I wish there was an option that would not allow underages to be transfered to future periods, however given the options we have, believe Sub Option 1 is the best path forward, requiring that any underage in period one be evenly split across Periods 2 and 3.

The Bay Cap should be reviewed at least once every three years. This should be a bare minimum.

You will hear from me again next week on the Coastwide TAC, please do the right thing and protect these valuable forage fish.

Taylor Ingraham

I am very concerned about the terrible problem in our waters.
After hearing testimony at a few of the public zoom meetings, I want to express my opinion and the dire need for you to quickly adopt the following measures.

The Chesapeake Bay Foundation supports
-- 3.1C;e – a 50% reduction in the allowable Chesapeake Bay harvest and a 13.6% proportional cap on the coastal harvest, referred to as TAC
--3.2.1B2:3 which is a quota catch percentage of 25%, 25% and 50% during the three harvest periods. Delaying the largest harvest until the last catch period will hopefully provide some time for the menhaden to grow
--revisit the catch limits at least in three years.

I appreciate your diligence in protecting our environment, wildlife and the future for ort children.

This decision must be done quickly, before it is too late and the consequences are irreversible.
Sincerely,
Tammy Laverty

Please, help us help the Osprey from extinction. This is a critical issue that needs our support . In the 3 years I have been a steward observing these magnificent birds I have seen a part of nature I never knew existed. My grandchildren are now fascinated with the Osprey and the nurturing given by them to their young. To think they may become extinct due to humans is heartbreaking. Please don't allow menhaden to be over fished .

Thank you ,
Paulette Derocco

Dear ASMFC,

As a resident of Maryland who spent years volunteering for the Smithsonian, I am concerned about the health and sustainability of the Chesapeake Bay. Given that the total menhaden population, a keystone species for the ecosystem, has been overestimated by a reported 37% (and declining rapidly according to researchers at William & Mary), I fear that it will be too late for the fish and the osprey/birds to wait for the upcoming studies to be completed. I would like to see action taken now to reduce the annual menhaden catch. We have waited for too long while industry has pulled too much out of the bay and delayed any meaningful studies to date.

I have personally seen many osprey nests fail in recent years. Right now, the reproductive rate in the bay area has fallen below the point of sustainability. In a 20-mile stretch along the southern end of the Patuxent river, only 11 osprey chicks hatched this past spring according to a naturalist who was tasked with taking the count. Given that there was a higher hatchling success rate further upstream where the food source is different (lots of goldfish!), it suggests that the population nearer to the bay that rely more heavily on menhaden for food has been impacted by the decline in the numbers of fish to the point of starvation for the poor osptry chicks. This incredibly sad -- we must do more to protect our resources and the environment -- for both marine life and wildlife.

Further, Virginia seems to be getting more than its share of the allocation of the total east coast annual limit, which gives the foreign commercial industry (using purse seine nets and aircraft) operating in that area too much influence on the health of the bay, particularly for the fishermen and nature lovers who live in Maryland. We are adversely impacted by the fact that too many fish are being removed from the ocean/mouth of the bay such that they don't make it further up the bay into Maryland waters.

Therefore, I support the proposal to reduce the annual catch by 50% and also support the 25%/25%/50% spread to push a higher percentage of the catch beyond the osprey nesting period. If a total moratorium was a choice, I would have supported that!

Thank you!

Barb Ripp

Dear ASMFC Menhaden Management Board,

Please find my public comment regarding the Draft Addendum II below. I would appreciate it if you acknowledge receipt of this email.

Comment:

Mr. Joseph Cimino, Chair
Members of the Atlantic Menhaden Management Board
Atlantic States Marine Fisheries Commission
1050 North Highland Street, Suite 200 A-N
Arlington, VA 22201

Re: Public Comment on Draft Addendum II

Dear Chairman Joseph Cimino and Members of the Atlantic Menhaden Management Board:

Thank you for the opportunity to provide public comment on the management of such a vital natural resource.

My late husband, who passed away more than a decade ago, spent most of his life on the water. Whenever he was not working, he was fishing. He loved pursuing large sportfish, including bluefin tuna and striped bass, as well as many other species off the coasts of New Jersey and Maine, where we owned homes. He passed his love of fishing and appreciation for abundant natural resources on to our two sons. One is a recreational angler in New Jersey, and the other is a wildlife biologist who monitors the health of our coast through the lens of our ospreys.

Through my sons, I have come to better understand the critical role Atlantic menhaden play in maintaining healthy coastal ecosystems. Based on what I have learned and heard, I believe a precautionary approach to menhaden management is essential to protect this important resource and the many species that depend on it.

Atlantic menhaden are a vital forage fish, filtering our coastal waters converting phytoplankton into energy-rich proteins and fats that support ospreys and many other marine predators. As a concerned coastal citizen, I believe menhaden management must account for their essential ecological role and

the needs of the wildlife that depend on them. Ospreys are increasingly showing signs of food stress and poor reproductive success along the Atlantic coast. As highly visible predators, they provide valuable insight into changes occurring throughout the marine food web. Precautionary management of Atlantic menhaden is warranted while research and monitoring continue to improve our understanding of menhaden availability, predator demand, and the broader ecological effects of commercial harvest.

I support a 50% reduction in the Chesapeake Bay Atlantic menhaden reduction fishery cap. I also support linking the Bay Cap to the coastwide total allowable catch (TAC), maintaining the Bay Cap at 13.6% of the TAC so that it remains proportionate to the coastwide limit as management targets change. The Bay Cap should not be allowed to increase substantially simply because the coastwide TAC increases.

I support allocating 25% of the Bay Cap to the first harvest period, 25% to the second, and 50% to the final period. Delaying a greater proportion of the allowable harvest until later in the season would provide a more precautionary seasonal approach and reduce the concentration of harvest earlier in the year.

I do not support reallocating quota overages between harvest periods. Allowing overages from one period to be shifted into another could undermine the intended limits and weaken the effectiveness of these seasonal safeguards. Clear accountability, consistent enforcement, and stronger oversight are necessary to ensure that established harvest limits are followed.

I believe the Bay Cap should be reviewed every three years, or sooner if warranted by new information. These reviews should incorporate the latest research and monitoring on the effects of industrial menhaden harvest on fish, wildlife, and overall ecosystem health. Management measures should be adjusted as new evidence becomes available to ensure that harvest levels remain sustainable and account for the ecological needs of predators that rely on menhaden as a food source.

Protecting abundant Atlantic menhaden is an investment in healthy fisheries, thriving wildlife, and resilient coastal ecosystems. I respectfully urge the Commission to place the ecological needs of Atlantic menhaden and the many species that depend on them at the center of its management decisions. A precautionary approach today will help protect these resources for future generations of anglers, wildlife, and coastal communities.

Thank you for your consideration of my concerns.

Sincerely, Cynthia Z Wurst, Waretown, NJ

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear ASMFC Officials,

I am writing to urge your support for actions to address steep declines in Atlantic menhaden populations, which are severely impacting nesting ospreys in the Chesapeake Bay. Specifically, I urge you to support a 50% reduction in the Chesapeake Bay reduction fishery cap (option B4) to 25,500 metric tons, as well as strict quota periods to distribute harvest evenly throughout the year rather than permitting an intense summer harvest.

Having worked in Chesapeake Bay conservation for 30 years, I have witnessed the decline of osprey firsthand. Where our community skies were once filled with osprey cries, they are now virtually silent, mirroring the alarming drops in osprey fecundity documented by scientists and volunteer monitors across the Bay. I have monitored the osprey nesting platform in our community and for the first time in 20 years, a mated pair is no longer building a nest.

Osprey nest production in the lower portions of the Bay dropped to a record low of 0.25 young per pair in 2026, down from 0.51 in 2024. On a global scale, ospreys require a breeding success rate of 0.8 to 1.3 young per pair to support a stable, self-sustaining population. In high salinity waters, 81% of all monitored osprey pairs failed to fledge any young at all during the 2026 breeding season due to food scarcity. According to the Center for Conservation Biology at William & Mary, this reproductive rate represents a catastrophic failure. The total number of birds successfully laying eggs has plummeted by 20% to 30%, a steeper initial drop than what was observed during the height of the mid-20th century DDT crisis.

Atlantic menhaden are a non-replaceable, nutritionally essential keystone species, serving as the primary food source for osprey and the foundation of the marine food web. Yet industrial processing extracts over 100 million pounds from Virginia Bay waters during a concentrated summer window. Recent data underscores the urgency of this issue:

- The ASMFC menhaden technical committee reported a 37% decline in overall coastwide menhaden biomass, raising serious sustainability concerns regarding the industrial fishery.
- The 2025 Potomac River Fisheries Commission report noted a menhaden bait fish harvest of just 169,423 pounds—an over 90% drop from the previous record low in 2023, and the lowest landing in 61 years of tracking.

As the Chesapeake Bay is home to the largest nesting osprey population in the world, adopting an ecosystem-based management approach for menhaden is essential. I also urge you to please support funding for a two-year, Bay-wide menhaden stock assessment and research into the full range of potential causes behind osprey nesting failures.

The impact of the ASMFC decisions regarding the Atlantic menhaden are of critical importance to the Chesapeake Bay ecosystem, and the fate of the Bay's osprey populations. Sustained reproductive deficits in osprey nesting success, largely driven by extreme food stress and localized depletion of Atlantic menhaden will result in a decline in osprey numbers by 14% annually and in a 50% total population collapse over the next decade if conditions do not change. I urge the Commission to recognize the importance of their decisions regarding the menhaden fishery to the osprey population and act with urgency.

Thank you for your public service, and for consideration of my comments.

Sincerely,

Nita Settina

Subject: Atlantic Menhaden Draft Addendum II

I am writing to express opposition to making cuts in the Chesapeake Bay menhaden fish caps without supporting science and proven causality and without the benefit of the results of studies currently underway.

Many inflammatory, anecdotal, and inaccurate statements are being put forth in support of making further cuts to the Bay menhaden fishing caps. The decline in osprey productivity is incorrectly being tied to “menhaden depletion” caused by “overfishing”. The commercial fishery is an easy target (especially compared to “climate change” or “pollution”) and is being unfairly demonized. Neither “menhaden depletion” nor “overfishing” in the Bay has been proven or is supported by scientific research. The ASMFC’s 2025 assessment states that the overall coast-wide menhaden stock is **not overfished, nor is overfishing occurring**.

Over twenty years of historical data shows us that osprey decline is independent of menhaden caps. The 1980’s were reported to be great years for osprey – there were no fishing caps in the Bay then. After declining osprey productivity starting in the 1990’s, fishing caps in the Bay were imposed in 2006 as a precautionary measure due to “**concerns”** of localized depletion. From 2006 to 2012, the Bay Harvest cap for menhaden was 109,020 MT. From 2013-2017, a 20% reduction was enacted. In the 2018 timeframe, this cap was reduced to 51,000 MT, a reduction of over 58,000 MT or about 53% lower than in 2006. This cap has remained unchanged since 2018. Yet again, osprey productivity has plummeted in recent years independently of the steady Bay harvest caps.

It’s déjà vu. Again today, there are “concerns” but no “facts” tying osprey productivity declines to overfishing. More research is needed to better understand local abundance of menhaden in the Bay and their migratory movements as well as other factors that are likely impacting osprey productivity and menhaden availability.

Correlation is not the same as causation. A third factor(s) often drives both.

Something else has changed, not only in the Bay, but across North America with drastically **declining bird populations everywhere**. The Cornell Lab of Ornithology says nearly 3 billion birds (over 30%) have been lost in North America since the 1970’s with shorebirds down 37%. This widespread pattern indicates that multiple environmental stressors, rather than a single fishery consisting of 6 boats, are influencing not only osprey’s productivity, but other birds across North America.

Current arguments to cut caps ignore the complexity of the Bay environmental system. It has many more components than just birds, fish and boats. You need to look for the big smoking guns that the research can help reveal and then a more informed decision based upon proven root causes can be made.

What <u>has</u> changed recently that could be impacting the health of birds AND fish in the Bay and East Coast? Several possible causes could result in osprey symptoms that look like the ones described in the Watts study.

(1)Water Quality: Early 2026 was a disastrous time for major chemical-related incidents affecting the Bay watershed. January to June 2026 included several major spills in the Bay releasing (a) **240-300 million gallons** of untreated sewage dumped directly in the Potomac River, (b) 3**2,000 gallons of jet fuel** from Joint Base Andrews leaked into a tributary of the Potomac, (c) **4,700 gallons of jet fuel** into the James River, and (d) **200 gallons of mixed waste fuel spill** in area of Baltimore's industrial waterfront Curtis Bay/Baltimore Harbor (June 2026).

Commercial menhaden fishing did not start until June in 2026, well after osprey arrived in March, established nests, laid eggs and started fledging young. A**ny observations made of osprey nesting problems before June 2026 were not caused by commercial fishing.**

- There is considerable overlap between the areas identified by the Watts study experiencing productivity issues and problem areas identified in the 2025 Chesapeake Bay & Watershed Report Card where eleven out of fifteen region scores decreased.

- **Chemical spills** can devastate bird populations long after the initial event, accumulating in the bird's tissues, causing death, long-term starvation or low-level poisoning. Breeding adults can transfer toxins to their nests which seep through eggshells, causing death or severe development defects in chicks. These same symptoms were observed in the Watt's study, but were attributed to starvation caused by overfishing, rather than starvation caused by toxic chemicals.

(2)Recent weather extremes, including rising air and sea surface temperatures, disrupt menhaden migratory patterns by forcing them to shift toward the north and to greater water depths where waters are cooler. Menhaden are unlikely to swim into shallow waters that are too warm or do not contain enough dissolved oxygen for their high metabolism rates. Heat waves, high temperatures, and declining water clarity in the Bay are also pushing eelgrass, an important nursery habitat for juvenile menhaden, into a steep decline.

Colder than average spring weather temperatures (like the cold snap in spring 2026 that froze up parts of the Bay) or delayed warming can delay menhaden entry into the Bay in the spring when ospreys are nesting.

Per NOAA, July 2026 was the hottest month on record in the contiguous US. Higher temps can kill young osprey chicks in the nest and fuel algae blooms which reduce oxygen levels resulting in dead zones that suffocate fish. These algae dead zones combined with increased pollution from storm water runoffs, further disrupting menhaden migratory patterns within the Bay.

The Bay 2025 Report Card says that 2024 "was the hottest year on record and there were extreme rainfall patterns" which increased storm runoffs. The winter of 2025-2026 brought freezing temperatures causing parts of the Bay to ice over, causing significant menhaden and trout kills around the Bay.

Global predictions of increasing temperatures will only exacerbate these problems.

July 2026's intense heat wave helped trigger a massive 14-mile fish kill in the upper Potomac and in the Baltimore Inner Harbor. USGS data showed water temperature peaks up to 98.4 degrees in the Upper Potomac during the July 2026 heat wave and 76 degrees in Baltimore's Inner Harbor. Menhaden prefer cooler water temperatures (from about 59- 68 degrees) and struggle to survive when temperatures rise much above this. **One of Dr. Bryan Watt's study areas in 2026 identifying the worst young osprey per pair productivity (<0.2) was the Potomac River area.**

(3) Bald eagle populations are at or near all-time highs in the Bay resulting in nesting overcrowding and direct competition with osprey to survive. When the larger eagles and osprey clash, osprey are nearly always on the losing side. Bald eagles compete for limited nesting sites and food, eat osprey eggs, devour chicks from the nest and steal osprey fish catches which can result in food deprivation or starvation for the osprey and their chicks.

(4) PCAS are an increasing concern and along with PCBs, pesticides, nitrogen, phosphorous, and other toxic chemicals like mercury are widespread in the Bay. The latest EPA data (2024) show 80% of Bay tidal waters are impaired or partially impaired by toxic contaminants. PCAS and PCB's are referred to as "forever chemicals". The Virginia Department of Environmental Quality's 2025 fish consumption advisories found widespread PCB contamination in **Mobjack Bay**, where the emaciated osprey chick photographed in the Watts study was found and has restricted human consumption of gizzard shad (a favorite fish of osprey) there due to persistently high PCB levels. Gizzard shad are an important food source for ospreys.

The Watts study noted widespread chick starvation in Mobjack Bay. PCB poisoning of osprey can result in symptoms much like the emaciated osprey observations from the Watts study, including reduced fertility, severe weight loss, emaciation, as well as reproductive failures including thinner eggshells, unhatched eggs and reduced clutch sizes. The Chesapeake Bay Foundation reported that PCBs are still found in 91% of Bay segments. Many toxic chemicals and pesticides bioaccumulate in tissues of fish and birds that eat these fish. Amounts of these chemicals in the tissues of birds increase up the food chain to apex predators like the osprey whose diet is close to 99% fish.

Chesapeake Bay's Program's Toxic Contaminants Workgroup advised that there is more research needed to address the science gaps in understanding how PFAS impact the Bay.

- **Neonicotinoids**, referred to as the "**next DDT**", have been linked to reduced bird and fish populations globally. They are now used extensively in the Bay area in agriculture, lawn maintenance applications, etc. Rice farmers near Lake Shinji in Japan starting using neonicotinoid insecticides that indirectly caused a collapse in their local commercial fishery yields. The chemicals didn't kill the fish directly, instead, they **starved them** by wiping out the zooplankton at the base of the food web. Maryland House Bill 91 (HB0091), introduced in the 2026 session proposes bans on neonicotinoid pesticides and is facing stiff opposition from pesticide manufacturers and Bay area agricultural groups. Since menhaden rely heavily upon zooplankton, neonicotinoids are a huge stressor on their population.

- **Neonicotinoids began to be used in the US after FDA approval of imidacloprid in 1991. Coincidentally this was around the same time declines in osprey productivity started as noted in studies by B. Watts.**

(5) Changing weather conditions in 2025-26 include a combination of drought conditions in Virginia and Maryland followed by heavy rainstorms. This has caused increased flooding and **stormwater**

runoffs into the Bay containing toxic wastewater, pollutants, chemicals and agricultural pesticides like neonicotinoids, etc. These runoffs directly and indirectly impact both bird and fish health and reproduction.

<u>In summary,</u> the root cause of bay osprey decline could be due to any one or, more likely a combination of the items listed above, or even other factors. It is a huge jump, without any supporting scientific data, to conclude the root cause is overfishing. Hungry ospreys do not prove a shortage of menhaden.

With shifting menhaden migration patterns due to many of the factors named above, no amount of Bay harvest cuts will reliably bring menhaden back to the increasingly hotter and more polluted Bay waters.

- **There is no evidence that reducing the fishing caps would restore osprey reproduction or bring menhaden back to where they used to be**

- **We live in a dynamic world. Conditions change and ecosystems respond. We cannot travel back in time.**

Rather than accepting theoretical postulations (i.e., starving birds equals menhaden overfishing) as facts, **t**ake the time to do the science - do the study first before making cuts. Find out all the real root cause(s) of changes impacting life in the Bay ecosystem.

Complete the studies before making decisions that will prolong identification of the real root cause(s) and delay actions to mitigate. Do the study first before irreparably and unnecessarily impacting the lives, welfare and livelihood of hundreds of families and communities associated with the Reedville fishery.

We would like to support the recommendations of the subject document to limit the amount of Menhaden allowed to be harvested.

While we realize that this will affect workers in the fishing industry, the recent reports of coastal Osprey nesting failures have convinced us that action needs to be taken to preserve these Ospreys as well as to ensure that the stock of Menhaden is sufficient to support a sustainable harvest for years to come. This is consistent with past efforts to limit crab and oyster harvests that have protected these species from overfishing.

Subject: [External] Public Comment on Draft Addendum II, Atlantic Menhaden

Categories: Menhaden 2 Auto Replied

To the Atlantic Menhaden Management Board:

In the survey I selected the options that would result in the least fishing, but my actual position is that **menhaden should not be fished at all,** for their own sake and for the many species that depend on them.

Menhaden are food for birds, whales, and other fish, several of which are declining in ways believed to be tied to fewer menhaden. The Chesapeake Bay is a nursery for many of these animals, and Virginia is the only East Coast state that still allows reduction fishing for fish oil and fertilizer. The Commission cut the Bay cap in 2012 and 2018 because earlier levels were too high. A reduction of up to 50% is a good step, but it should be a minimum.

Please weigh the interests of everyone with a stake in a healthy Bay and coast, including the public and wildlife, not only those who fish.

Thank you,

Krista Maloney

Categories: Menhaden 2 Auto Replied

All actions must be taken to reduce the numbers of fish as much as possible. These are a vital fish to a healthy ecosystem and absolutely we should not be taking them for fish oil, fertilizer or farmed fish food.

There are very few people who are Food insecure and need these Fish, the vast majority of people do not need to eat fishes and we need to allow the oceans to replenish. The absolute ideal would be no fishing whatsoever.
Thank you

Subject: [External] Menhaden public comment

Categories: Menhaden 2 Auto Replied

Dear Atlantic Menhaden Management Board,

My Name is Greg McCrickard and I am a recreational angler living in Virginia and Maryland. I've been fishing the Chesapeake much of my life in both Maryland and Virginia. I'm an avid striped bass and red drum angler who cherishes our resources here in the bay, as well as along the greater Atlantic coast.

Here are my public comments on the record for the Chesapeake Bay Cap:

- 3.1 Chesapeake Bay Reduction Amount. I choose option B4 - a 50% reduction in the current bay cap which would result in a new bay cap of 25,500 mt.

- 3.2.1 Chesapeake Bay Reduction Fishery Cap Quota Period. I choose option B1 - even length and even harvest.

- 3.2.2 Chesapeake Bay Reduction Fishery Cap Quota Period Overages and Underages. I choose Underage Sub Option 1 where an underage in quota period 1 would be split evenly and rolled over to quota periods 2 and 3.

- 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision. I choose option B. Where the Chesapeake bay cap will be reviewed at least once every three years.

The Bay ecosystem is clearly in Crisis mode. We need a 50% reduction to the current Bay Cap as there was an error in the previous natural mortality estimate used in the stock assessment. We drastically overestimated the Atlantic menhaden stock because of this natural mortality error. The bay cap has been set way too high for way too long! And it's readily apparent to folks that spend most of their time on the water. From light tackle fishing guides to large charter boat operations, everyone is experiencing less menhaden in our waters. Our osprey are starving and if this isn't the canary in the coalmine, I'm not sure what is…

It's sad seeing our bay being slaughtered by a massive industrial fishing operation. We now have the chance to at least reduce their cap to conserve the population. Surely its time to put the resource first and help support and revive a great recreational fishery for striped bass where the sportsman's dollars will far outweigh the revenues generated by the commercial menhaden fishery in Reedsville, VA.

Let's please put the ecosystem first and conserve menhaden before it's too late.

Respectfully,

Greg McCrickard

ASMFC Members,

As a very concerned lifelong citizen of the Chesapeake Bay area, a passionate conservationist and strong believer of balance in nature, I fully support the following sections of the subject Addendum.

- **3.1 Option C1e:** Reducing the initial Chesapeake Bay Cap by 50%, from 51,000 to 25,550 metric tons.
- Establishing the Bay Cap at 13.6% of the coastwide total allowable catch so it can adjust when the coastwide quota changes.
- **3.1 C2a:** Maintaining 51,000 metric tons as the maximum Bay Cap, with no fixed lower limit.
-
- **3.2.1 B2:** Even Length & Uneven Harvest. Allocating 25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period.

- ***This is particularly important in view of unsuccessful osprey breeding and survival of hatchlings as evidenced by biologist and birder monitoring. I have personally noted the same in formerly active/successful nests in the Choptank River and its creeks. In addition, other marine species that rely on menhaden, for example striped bass, have been declining for years.***
- **3.2.2:** Require early- season quota period overages to be deducted from the corresponding period during the following year.
- ***A quota is a quota. A limit is a limit. There should be no overages.***
-
- **3.3 Option B** Revisit Provision: The Chesapeake Bay Cap and related management measures will be revisited every three years following implementation of this draft addendum.

In addition, I strongly support Virginia being required to create a 3-mile limit on reduction fishing like all the other states on the Atlantic Seaboard. There should be no menhaden harvesting in the Chesapeake Bay until there is conclusive scientific evidence that all

the Bay's marine species needs are satisfied before industry's wants.

Sincerely,

Rhonda Franz-Floyd
Trappe, Maryland

Hi,

The message is simple, overfishing of this critical species needs to stop.
For the health of our fisheries and the well being of our planet.

I've been fishing in this area since I was a small boy, I'm 53 now.
I've seen almost no Menhaden these past few seasons of fishing on Long Island Sound, and it's sad.
For me, my children, and future generations.

Pleas find a sustainable way to manager this problem.
Things were ok a few years ago and now they're not, so the answer should be clear.

We need action taken soon,
David

I am strongly urging strongly requesting actually pleading with you to consider limiting how many Manhattan are allowed to be fished out of Chesapeake Bay this food is essential for ospreys whose populations are declining their nests are failing, and chicks are not being hatched. They are seriously being endangered by this proposal. I don't see a need for this proposal. You know grid can't always be the driving force neither can profit. These decisions like foresight, they do not take in the bigger picture, and our threat to not just animals but humans as well. We are destroying ourselves very quickly and there's no bouncing back we are destroying land for all kinds of development we are destroying the environment through our actions and once all that is gone when the insects and the animals and the land are gone and the water is polluted And the air is unbreathable and the weather is out of control that it's too late. So please be smart, be bold, and do what is right for all concerned every living being on the planet both now and for the future Thank you

Please vote to PASS this addendum in order to help save the Menhaden population and subsequently our Osprey. I live in Maryland and have friends and family that live along the Magothy River. The Osprey return each year and bring so much enjoyment. Unfortunately, the last three years haven't been good. Three seasons ago a mature offspring died due to starvation. It was horrific. The past 2 years they haven't reproduced. Passing the addendum is critical to the future of the Osprey and the health of the ecosystem which supports so much more.

Thank you for your attention to this extremely important matter. I am grateful for the opportunity to voice my concerns .

Sincerely,
Diane Irven

Atlantic States Marine Fisheries Commission
1050 N. Highland Street, Suite 200 A-N
Arlington, VA 22201

Subject: **Strong Support for a Minimum 50% Reduction in Menhaden Catch Limits to Protect Ospreys**

Dear Members of the Atlantic Menhaden Management Board,

I am writing to express my strong support for imposing at least a 50% reduction in the commercial menhaden catch limit in the Chesapeake Bay, as well as establishing broader regional protections along the Atlantic seaboard.

Atlantic menhaden are a foundational forage fish that sustain an array of marine life and coastal wildlife. Among the most vulnerable to current stock declines are Ospreys, which rely heavily on healthy menhaden populations to successfully feed and raise their young. I have personally witnessed the decline on the Connecticut and Maine coasts. Recent breeding data paints an alarming picture: a survey of 101 Chesapeake Bay Osprey nests this past summer revealed just three successful fledglings. Similar reproductive failures and population pressures are being recorded further north up the Mid-Atlantic coast. The CT Audubon Society reports a steep decline in Connecticut's Osprey population and breeding success driven primarily by the scarcity of Atlantic menhaden, the Osprey's primary food source. The Society reports that in 2025, 1 in 6 nests failed and in 2026 1 in 4 have failed.

These catastrophic breeding numbers point directly to localized overfishing and depletion of crucial forage fish resources. Just as conservation organizations like Connecticut and Maine Audubon stepped

up decades ago to help Ospreys recover from the devastating impacts of DDT, we must act decisively today against this new threat to their survival.

Without sufficient food supplies, regional Osprey recovery will reverse. The evidence clearly indicates that overfishing in the menhaden fishery is a significant factor contributing to these troubling trends. A minimum 50% reduction in the menhaden harvest limit in the Chesapeake Bay is a necessary and urgent step toward restoring ecological balance and ensuring that Ospreys and other dependent species have adequate food during critical breeding seasons.

I urge the Board to adopt a 50% or greater catch reduction at its November 2026 meeting and implement robust ecological management measures to safeguard our coastal ecosystems.

We humans are causing the decline in this fishery and negative effects on Osprey survival. It is our responsibility to rectify it. Thank you for your time, consideration, and leadership on this critical conservation issue.

Sincerely,

Gertrude Prior

Dear Members of the Board,

I am a sports fisherman who loves fishing for Striped Bass. I have also fallen in love with Ospreys after seeing one dive into the water as I was fishing for Stripers and fly away with a bunker back in the early 80's. It's a memory that has remained with me for over 40 years.

It has also been a joy to watch the Osprey population grow over these past 40 years, and it never ceases to amaze me to see one hit the water feet first and fly away with a bunker.

It's been incredible to watch the Bass population grow with the ever changing size and limit restrictions over these past 40 years as well. Sadly this has been the worst season I've experienced as a Bass fisherman and the Ospreys have not done as well either. There are very few menhaden/bunkers in the water. I do not see the river of rafts of them as I have in the past. The menhaden is a keystone species that many different species depend on, including people employed in the sports fishing industry in bait and tackle shops, fishing guides, boat dealers and clothing manufactures, to name a few.

I have always supported the size & limit restrictions on the Striped Bass fishery. I fully support the 50% reduction in the harvest of menhaden. Please don't let this keystone species collapse. Striped Bass and Ospreys are depending on you to limit the harvest of menhaden, and those of us who enjoy catching and watching them too.

Thank you,
Steve Saunders

To Whom it may Concern,

As a volunteer Osprey Nation volunteer for the Audubon Society in Connecticut, I have personally witnessed a dramatic reduction in successful osprey nests over the past two years. It seems this is a direct result of the reduction of their primary food source, Menhaden. I urge the Commission to do everything it can to reduce fishing pressure on Menhaden before it is too late!

Thank you.

Board members,

I am a long time resident of the CT shoreline and an Osprey Steward in CT for the past several years. I have witnessed a significant decline in ospreys over the past few years. This year was especially distressing with the viability of the osprey population, especially their young. Hearing the young ospreys crying for food with absent adults is heartbreaking. I feel this is all related to a lack of an available food source and overfishing.

I support a 40% reduction to approximately 112,100 metric tons for years 2027 and 2028.

Thank you for your time and consideration into this matter.

Please pass this addendum. I live on the Magothy river in Maryland and lost an osprey three years ago due to starvation, and it was heartbreaking to learn of its cause of death by our local raptor, For the past two seasons there have been no offspring. The Menhaden are an important component to our ecosystem for the Chesapeake Bay and its surrounding subsidiaries and crucial to the survival of the Osprey. Thank you for your attention to this very important matter. I am so graceful to finally have a place to voice my concerns as this has troubled me for over the last three years.

Sincerely, Nancy Hisky

In our area of CT we have seen significant reductions of osprey these past 2-3 years. Seems from at least in part to overfishing of menhaden. I would support a cut of 50% in the cap on fishing these fish which are popular for ospreys. A lot of work has gone into brining the osprey back from being endangered. It all is being squanders now by overfishing

To The Commission,
I am calling on the Commission to reduce the fishery cap by 50%, to ensure that menhaden, a key foundation fish and a prime source for Connecticut's Osprey, are not put in greater jeopardy.
I have been an Osprey monitor with Connecticut Audubon for five years. I monitor Greenwich Osprey Nest #41. The pair failed to produce offspring this year.
It has been so great to celebrate the comeback of the Osprey after their DDT ordeal in the seventies. For the Osprey and their offspring to now starve when there is a solution is heartbreaking. You can act to help reverse this devastating decline of menhaden and the impact it has on the magnificent Osprey. I urge you to reduce the fishery cap by 50%.

Good evening.

My name is Tom Rogers. I'm a Maryland citizen and someone who has great concern about the overfishing of menhade and its impact on the birds and wildlife in our area, specially the impact on osprey in the Chesapeake Bay.

It is my understanding that there is an opportunity to implement management reforms through the Atlantic States Marine Fisheries Commission's Draft Addendum II, in particular via the upcoming November ASMFC Menhaden Meeting.

I urge you to do the following:

- Support option C1e: that reduces the CAP by at least 50 percent in 2027 and limits the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC);
- Also, please support option C2a, which sets an upper limit of 51,000mt for the Bay Cap (the current level);
- In addition please support option B2, which establishes three even length quota periods for the Bay Cap, but distributes harvest 25% in period 1, 25% in period 2, and 50% into period 3 and option B, which establishes quota period overage and underage provisions within a fishing year;
- Finally, I urge you to support Option B to revisit the Bay Cap every 3 years.

I am proud to add my voice to those who have concern over the long-term future of the Bay and the birds and wildlife who inhabit it.

Thank you for your consideration,
Tom Rogers

I support increased restrictions on the Atlantic menhaden fishery. I will be brief as what I am saying is no secret to the Commission and most others concerned about this fishery. Atlantic menhaden of all ages are a significant food source to many fishes, birds, and mammals of the Atlantic coast. Reductions in its biomass can cause disruptions up the food chain with similar effects to higher order consumers. Certainly, we can protect this valuable resource while maintaining a viable fishery, one that is managed scientifically and not just by greed and profit. I thank the dedicated fisheries professionals who are charged with managing coastal fisheries using the best scientific findings and balancing the goals of all user groups.

Sincerely,

Donald J. Danila

I strongly encourage you to lower total allowable catch (TAC) limits and to reduce the Chesapeake Bay harvest cap by at least 50% if not more. The osprey population on the coast of New Jersey has not been procreating due to a lack of food. Menhaden is an integral part of our marine ecosystem, and should not be allowed to be overfished by commercial outlets.

Please protect this beautiful and integral natural resource. Thank you.

To whom it may concern,

My name is Abigayle McLennan and I am a fisherman in Maine. I have been fishing for menhaden with my family here on the coast for the last 6 years. I am deeply concerned about the potential cut in quota and the ripple effect this will have on the lives and livelihood of hundreds of thousands of families here in the state of Maine. Our entire economy here in the state of Maine is directly tied to the lobster industry. If there is no bait (I.e. menhaden) there is no lobster fishery. This doesn't just directly affect us families who have been seining for the menhaden it will be a hit to everyone on the coast. The lobster industry employs people beyond those on the water themselves. I hope that whoever is taking the time to read and consider these messages will look at the non-existent scientific data for New England and realize that this is a MUCH broader fisher than just the Chesapeake Bay. We absolutely can not stand to face another quota cut here in Maine because of the feelings of activist groups in the Chesapeake Bay Area.

I appreciate your consideration of my thoughts on this addendum.

Hello this is Thomas McLennan from Spruce Head Maine.
Here in Maine we rely on menhaden for bait for the lobster Industry.
Managing the entire east coast based of the Chesapeake bay will harm our small boat fishery up here. There is no science on the menhaden biomass up north here where we are.
There has been changes in ecosystems and climate change that may have moved the menhaden more north.
Last year we were hit with a quota reduction and are now done fishing this season a month earlier than last year.
On behalf of all of us Maine small boat menhaden fishermen and Maine lobstermen I ask you to not cut our quota any more. If anything give us more quota as the fish are abundant here.

thank you.

Subject: [External] Public Comment on Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Atlantic States Marine Fisheries Commission (ASMFC),

I am a resident of the Chesapeake Bay watershed who lives directly on the Chesapeake Bay and I am writing to voice my support for Draft Addendum II. I request that the Commission select Option B4 to reduce the industrial menhaden reduction fishery cap in the Chesapeake Bay by 50%, bringing it down to 25,500 metric tons. I also support splitting the remaining quota into seasonal periods to better protect our coastal waters.

The health of the Chesapeake Bay is central to our region's identity, environment, and economy. Menhaden are not just food for iconic species like striped bass and ospreys; they are a critical ecological component of the Bay itself. When healthy populations of menhaden filter our waters and sustain the food web, our entire ecosystem benefits.

The intense concentration of industrial reduction fishing in the Bay harms our local tourism, recreational opportunities, and local wildlife. It is vital that our fisheries managers shift toward true ecosystem-based management that protects the public trust rather than allowing a single company to deplete local resources during the summer months.

Please take decisive action to restore balance to the Bay. I ask you to support the 50% cap reduction under Option B4 and establish seasonal safeguards for the fishery.

Sincerely,

Christopher Blake

Churchton, MD

Categories: Menhaden 2 Auto Replied

I believe strongly that the ASMF Commission move forward and put further restrictions on menhaden fishery limits. The recent Connecticut breeding season results for the Osprey, whose main food source is menhaden, is proof positive that there is not enough menhaden available to sustain and grow the Osprey population. A precipitous drop in numbers, the past two years especially, in both chicks being born and fledged chicks cannot be ignored.
I am a resident of Connecticut and understand and appreciate the role the beautiful Osprey plays in our coastline, river, and even lake ecologies. Please, while we can, act to protect these birds and all the interconnected wildlife and reduce the fishery cap by minimum 50%.
Thank you,
Dorothy Galant

Subject: [External] Atlantic Menhaden Draft Addendum II – Public Comment

Categories: Menhaden 2 Auto Replied

To the Members of the Atlantic Menhaden Management Board, Atlantic States Marine Fisheries Commission:

I am writing as a recreational angler who cares deeply about the long-term health of our coastal fisheries. I ask the Board to adopt the strongest conservation measures in Draft Addendum II, specifically a 50% reduction in the Chesapeake Bay reduction fishery cap, together with seasonal quota periods.

Coastwide models suggest the stock is stable, but they don't always capture localized depletion, which many of us observe firsthand. Atlantic menhaden are a cornerstone forage species along the Atlantic coast, and how they are managed in the Chesapeake Bay affects predators far beyond it.

Here in Connecticut, I and others have seen signs of forage stress this season. Osprey nests have failed in numbers that are hard to ignore, with parents seemingly struggling to find enough fish to feed their chicks. On the water, anglers are reporting thin striped bass and far fewer bait balls than in past years. While many factors can contribute to these changes, concentrated commercial harvest during the summer months, when migratory fish and birds most need forage, is a risk the Board can address.

I urge the Commission to prioritize ecosystem-based management that reflects menhaden's full ecological value, including their role as prey for striped bass, osprey, whales, and other species. Our coastal economies, recreational fisheries, and wildlife all depend on a healthy food web.

Thank you for your time, your work, and your careful consideration.

Respectfully,
Robert Groat
Westport, CT 06880

Categories: Menhaden 2 Auto Replied

I have studied Bald Eagles and Ospreys for 50 years and was involved in the Bald Eagle restoration program with Cornell University in 1976-77. I also have followed osprey populations since then. What is happening to the osprey, after coming back from the brink due to DDT contamination, is a travesty. It is time to take action and reduce the menhaden catch being taken from the waters the osprey depends on for its food. I urge you to do so.

Sincerely,

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

I will start by saying that I am not an expert on menhaden or fisheries in general.

I have known about the large-scale commercial harvesting of Menhaden for some time. Many of my peers have been following along and sharing their concern about how many menhaden were being taken for years.

When studies started showing up in the local news about ospreys potentially being affected by the overharvesting of menhaden, I started following closely.

I have taken the last year and a half to educate myself and talk to many experts.

They are raising the alarm, and I believe that they are correct.

Please, cut back the total allowable catch of menhaden by the proposed minimum of 50%.

The Ospreys are our canary in the coal mine. If we do not act soon, I believe that the damage will be irreparable.

Thank you for reading.

Best,

Andrew Tonra

To Whom it May Concern,

I support Draft Addendum II (Chesapeake Bay Cap)and the most restrictive options.

The future of our wildlife must be protected and preserved, and if not now - when! There must be at minimum, a 50% reduction in the overfishing of menhaden. No additional studies are needed. It is time to act.

Sincerely,

Subject: [External] Menhaden

Categories: Menhaden 2 Auto Replied

My name is Lynwood Franklin and I am a recreational angler in Virginia. I fish the Rappahannock River, including the tidal river from the mouth up to buoy 10. I am writing as a private angler, not for a club or company.

I support Option C with sub-option C1e and sub-option C2a on the Bay cap amount; Option B with sub-option B2 on quota periods; and Option B on the revisit provision.

Industrial reduction fishing in the Bay has changed how, and how often, I can fish the Rappahannock. The river fishes when menhaden are in it. Striped bass, bluefish, speckled trout, puppy drum, and Spanish mackerel show up behind those schools. When the schools are gone, the predators are gone, and a day that used to be a matter of finding birds and bait becomes a long ride for very little.

That lines up with the timing problem this addendum describes. The reduction season runs from the first Monday in May to the third Friday in November, which is the entire recreational season on this river. In 2023 and 2024 more than half of Bay reduction landings came in a six-week stretch in midsummer. Those are the weeks the Rappahannock should be at its best. Instead I have watched the bait disappear in a short window, birds quit working, and the fish I came for leave the stretches I have fished for years.

The Bay cap was meant to keep that from happening in a nursery system. At 51,000 mt it no longer does that job. It has not moved while the coastwide TAC has, including the 20% cut in 2026, so a larger share of the coastwide catch can now come out of the Bay. Pound-net catch per unit effort in Maryland, Virginia, and the Potomac River Fisheries Commission dropped in 2024, Maryland's harvest was down sharply from the 2018–2022 average, and fishery-independent indices fell off in 2024–2025. Striped bass are overfished.

I do not need a coastwide stock assessment to tell me the forage those fish follow is not reliable in this river in summer. C1e puts the Bay cap at 13.6% of the TAC, about 25,500 mt under the current TAC, and keeps that proportion so a future TAC cut actually reaches the Bay. C2a keeps the cap from climbing back above 51,000 mt and does not set a floor that would block a deeper cut later. A one-time 50% cut under B4 would help, but it repeats the mistake this addendum is trying to fix: a fixed Bay number that drifts out of line with the coastwide quota.

On timing, B2 is the option that matches the problem on the water. An even-length split that holds the first two periods to 25% each, and leaves 50% for after mid-September, is the only choice that pulls meaningful harvest out of the late-spring and summer weeks when recreational fishing, and predator feeding, depend on those fish being in the tributaries. Status quo, and to a lesser extent B3, leaves the midsummer pulse in place. Equal thirds under B1 is better than nothing, but it still allows a third of the Bay cap in the worst weeks.

I also support revisiting the cap at least every three years. The Board is being asked to act while Bay-specific research is unfinished. That is a reason to take the precautionary cut and the seasonal split now, and to look again when the research is in, not a reason to wait.

The reduction fleet can still operate. These options change how much comes out of the Bay and when. Leaving the cap and the timing alone continues to put the cost on the rest of us who fish the Rappahannock for food and sport rather than for meal and oil.

Thank you for the chance to comment.

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Hello,
My name is Richard Reiter and I live in Chester, MD. I am very concerned about the health of the Chesapeake Bay, its osprey, its menhaden, and all the other communities and predators that depend on a thriving estuary. I am particularly disturbed about the decline of osprey over Macum Creek that I've witnessed over the 16 years I've lived here.

I support the following options in Draft Addendum II:

3.1 Chesapeake Bay Reduction Fishery Cap Amount
Support option C1e: that reduces the CAP by at least 50 percent in 2027 and limits the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).

Also, Support option C2a, which sets an upper limit of 51,000mt for the Bay Cap, which is the current level.

3.2 Chesapeake Bay Cap Distribution

Support option B2, which establishes three even length quota periods for the Bay Cap, but distributes harvest 25% in period 1, 25% in period 2, and 50% into period 3.

Also, support, option B, which establishes quota period accountability measures within a fishing year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision

Support Option B Revisit Provision, to reassess the efficacy of these new management tools every 3 years.

Thank you for consideration of these comments. Please support a struggling Chesapeake Bay by strengthening menhaden conservation measures.

Sincerely,

Richard Reiter

I am advocating for stronger, science-based protections that support healthy fisheries and thriving ecosystems, including lower catch limits and immediate and severe reductions in Chesapeake Bay limits. I support the most restrictive options. It is so sad to see the impact on ospreys as well as whales, dolphins and striped bass. Watching many ospreys on cameras abandoning their nests and babies due to lack of food and watching the babies starve to death has just been tragic. Action is needed now!

I am happy to support the written comments submitted by the Garden State Seafood Association.

I would like to also suggest that if there truly is a decrease in the menhaden population, the use of seismic testing for Industrial Offshore Wind Development (IOWD) during the spawning period of menhaden could have played a significant role in reducing menhaden recruitment. Rutgers University has suggested that a scientific study by Rutgers could substantiate such an impact. If IOWD has had such an impact on the menhaden population as anticipated in the SEIS submitted to BOEM, it would make sense to contract with the University to study the impact to see if the use of seismic testing exceeded the overall anticipated assessment. Since future sites for IOWD are currently being explored, documentation of the current impacts can help reduce future "over fishing" of the biomass with limitations on where and when seismic testing and pile driving can take place.

Categories: Menhaden 2 Auto Replied

Hello,

I fully support changes regulation limits to decrease the volume of menhaden fishing in the Bay. Regulations are created to prevent harm. Currently, the Osprey population in the Bay is at severe risk. Where previously we had greater than a thousand active breeding nests, this year we had just over 100. Sadly, the vast number of these nests did not yield viable young as food supply is diminished. Menhaden is the main staple of these iconic treasure birds. Businesses will adjust to lower limits to supply pet food protein with alternative sources, but the birds cannot. They are clearly struggling. Please support our native wildlife in the Bay!

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

To Whom it May Concern,

I'm writing from Maine in support of meaningful action through Atlantic Menhaden Draft Addendum II.

I've fished Maine waters for nearly 20 years, am a Registered Maine Tidewater Guide, and am the owner of Old Maine Outfitters, a fishing outfitter. While I'm far from the Chesapeake Bay, what happens there directly affects fisheries throughout the Atlantic coast.

Given the recent problems identified with the menhaden assessment, I believe a more precautionary approach is warranted. We now know abundance was overestimated and fishing mortality underestimated, which makes continued concentrated harvest in the Chesapeake especially concerning.

For Draft Addendum II, I support:

- **Section 3.1: Sub Option B4** — Reduce the Chesapeake Bay Cap by 50%, to 25,500 mt.
- **Section 3.2.1: Option B1** — Even Length & Even Harvest.
- **Section 3.2.2: Underage Sub Option 1** — Split any Quota Period 1 underage evenly between Periods 2 and 3.
- **Section 3.3: Option B** — Review the Chesapeake Bay Cap at least once every three years.

I also oppose linking the Chesapeake Bay Cap to the coastwide TAC. The Bay is too important ecologically for its protections to rise and fall with broader coastwide quota decisions.

As a striped bass angler and guide, I see how important healthy forage populations are. Protecting menhaden is part of protecting the fisheries that depend on them.

Thank you for considering my comments.

Patrick Rudman
Owner, Old Maine Outfitters
Registered Maine Guide

Categories: Menhaden 2 Auto Replied

Dear Mr. Boyle:

I strongly support a 50% reduction in the Chesapeake Bay reduction fishery cap (Option B4/ reducing the cap to 25,500 metric tons) and support seasonal quota periods!

I live along side Cattail Creek off the Magothy River, on land that's been in my husband's family for more than 100 years. We care deeply for the Bay ecosystem and all of the creatures that call it home. For many years we have enjoyed watching the local osprey prepare a nest, raise their chicks and finally fledge with "flying lessons" from their parents before we say goodbye for the season, usually in mid-September. But for the last several years there has been no successful nesting here, which mirrors declining productivity and widespread nest failures among our Chesapeake Bay osprey population overall. Along with the stressed populations of striped bass, these declines signal an URGENT need for precautionary conservation practices NOW.

Industrial reduction fishing extracts over 100 million pounds of fish in a concentrated summer window, damaging the local food web and depriving other groups, especially watermen and anglers, of fair access.
We urge fishery managers to implement strict quota periods that will distribute the harvest evenly across the year rather than allowing an intense summer harvest.

We can't wait for the results of a study to do what needs to be done NOW. As was done with the rockfish crisis, the season should actually be closed to encourage recovery. A 50% reduction is already a compromise, a coast-wide reduction would be better still.

Please support responsible stewardship of the entire Bay ecosystem before it is too late!

Most sincerely,

James B. Crafton
321 South Drive

Severna Park, MD 21146

Categories: Menhaden 2 Auto Replied

Atlantic States Marine Fisheries Commission,

I am the owner and captain of Seasider Charters LLC. We operate ecotours in both the lower portion of the Chesapeake Bay and the Seaside of the Eastern Shore of Virginia. Our charter business is one of many in this coastal region that depends on a healthy, properly managed fishery. The coastal region of Northampton County where my business operates remains the hardest-hit area by the menhaden reduction fishery. Net-set data show that more menhaden reduction nets are set in Northampton County than in any other county on the Eastern Seaboard. The Northampton County Board of Supervisors recognized the inequity and the socioeconomic strain the menhaden reduction industry places on our region of the Chesapeake Bay and local businesses. For this reason, the Northampton County Board of Supervisors unanimously approved an Industrial Menhaden Moratorium Resolution. The resolution came after years of county concerns regarding the health of the menhaden stock, record low striped bass and osprey recruitment numbers in the Chesapeake Bay, and public health and economic issues caused by the industry's persistent fish spills and concentrated extraction in the lower Chesapeake Bay region. The resolution remarks that the ASMFC and the Atlantic Menhaden Technical Committee can not provide Northampton County scientific assurance that the spatial or seasonal stock of menhaden in the Chesapeake Bay is healthy, or quantify the ecological and socioeconomic impact of localized depletion due to concentrated industrialized Atlantic menhaden fishing techniques in the Chesapeake Bay. The ASMFC should take the most conservation minded reforms available at this point in time until scientific assurance can be provided.

I call on the ASMFC to approve conservation-minded reforms that better protect menhaden and support a healthy Chesapeake Bay ecosystem and the businesses that depend on a healthy ecosystem, including reducing the Bay Cap by 50 percent in 2027 and implementing quota periods to more effectively distribute reduction fishing pressure throughout the season. Specifically, Seasider Charters LLC supports the following options in Draft Addendum II:

-
-
- 3.1 Chesapeake Bay Reduction Fishery Cap Amount: Support option C1e that would reduce the Bay Cap by 50 percent and limit it to 13.6 percent
- of the Coastwide Catch Limit (TAC). Also, support option C2a which sets an upper limit of 51,000mt for the Bay Cap, which is the current level.
-
-
-
- 3.2 Chesapeake Bay Cap Distribution: Support option B2 which establishes three even length quota periods for the Bay Cap, but distributes
- harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. Also, support option B which establishes quota period overage payback and rollover of unused quota within a fishing year.
-
-
-
- 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: Support option B Revisit Provision to reassess the efficacy of these new management
- tools every 3 years.
-

Support these conservation-minded reforms. Local businesses like mine are depending on you to take action and properly manage our fishery.

Thank you,

Captain Tom Burkett
Seasider Charters LLC
Northampton County Virginia

Subject: [External] Atlantic Menhaden 2027-2028 TAC

Categories: Menhaden 2 Auto Replied

I am long-standingly well aware of the significance of the menhaden Atlantic fishery from a harvesting, ecological and environmental standpoint.

Apparently, there was already a noticeable decrease in these fish populations as early as last year, but only became a significant factor with the impacts seen this year.

The failure of the Osprey fledge is an early visible warning sign of the imminent collapse of menhaden along the eastern coast. This potential (if not already upon us) will affect the food chain for all species dependent on them, among them, but certainly not limited to, whales, dolphins, seabirds, marsh wildlife, our recreational and fishery catches, which include those used for fertilizers, fish food and pharmaceuticals. We are over harvesting this dependent upon species which can ultimately lead to further environmental collapse.

I am aware and support the utmost protections of the Atlantic menhaden along the entire coast from Maine to the Carolinas, including the Chesapeake Bay. Certainly a 50% reduction in catch limits is the least appropriate at this time to avoid total collapse and allow for recovery over time. Without sufficient spawn and young of year I fear we may be in for the worst detrimental effects.

Please, at least for the short term, modify the reduced fishery cap to conserve the species providing them with the utmost viable protection.

Sincerely,
Donald Weigl
Barnegat NJ

Subject: [External] Protect our Ospreys

Categories: Menhaden 2 Auto Replied

Hello,

I am lucky enough to have ospreys fly behind our house in CT from May-September. They are majestic creatures, critical to our habitat. So I was very distraught to hear they had their worst breeding season ever.

I'm urging the Atlantic States Marine Fisheries Commission to reduce the Chesapeake Bay menhaden fishery cap by 50% to help ensure there are enough fish for Ospreys and other wildlife. We need to make sure the ospreys have enough food and are not put in jeopardy as they have been in the past.

Please, safeguard the ospreys' future.

Thank you for your consideration,
Amy Thomas
Southeastern Connecticut

I strongly support a 50% reduction in the Chesapeake Bay fishery cap and also the seasonal quota periods. It was a dream come true when we moved to Drum Point on the Chesapeake Bay in 2014. Learning about the ospreys was fascinating and having a front row seat to their spectacular fishing abilities has been a highlight of living on the Bay. Sadly, we have also watched the numbers of birds decrease and I have also found them dead on the beach. This is an issue of critical importance. We cannot wait for research that will take years. The numbers are already in and the depletion in their source of food needs to be managed NOW!

I feel strongly that a complete moratorium on the harvesting of the Atlantic Menhaden should be put into effect immediately. At this point any more studies to show the effect that their loss has had on the Osprey is redundant. The empty nests, the emaciated bodies of the few chicks that have managed to survive should be enough proof that the loss of this fish has been catastrophic. After fighting back from near extinction just a few decades ago this beautiful bird deserves better from the human beings that literally hold the strings to their survival.

Subject: Comment in Support of Reducing the Chesapeake Bay Reduction Fishery Cap and Implementing Quota Periods (Draft Addendum II)

I am writing to express strong support for Draft Addendum II to the Atlantic Menhaden Fishery Management Plan, specifically endorsing options that reduce the Chesapeake Bay reduction fishery cap by up to 50% and establish seasonal quota periods to distribute harvest throughout the fishing year.

Atlantic menhaden (Brevoortia tyrannus) play a foundational role in the marine food web. As filter feeders, they clean the water column, and as a critical forage species, they sustain predator fish like striped bass, bluefish, and weakfish, as well as marine mammals and coastal birds. The Chesapeake Bay serves as the East Coast's primary nursery ground for menhaden and countless predator species that depend on them. Protecting the biological health and ecological function of this specific body of water is essential for the broad long-term success of Atlantic fisheries.
Reasons for Supporting the Proposed Changes:

Mitigating Localized Depletion: While coastwide stock assessments evaluate menhaden abundance across the entire Atlantic,

they do not capture spatial dynamics or localized depletion within the Chesapeake Bay. Concentrating heavy industrial purse-seine fishing within the Bay depletes the immediate forage base needed by resident and migratory predators, creating localized food deficits even when coastwide stock numbers appear stable.

Building on Historical Precedent: The history of menhaden management reflects a progressive understanding of the Bay's ecological sensitivity. From the initial 2006 cap (109,020 mt) to the reductions under Amendment 2 in 2012 (87,216 mt) and Amendment 3 in 2018 (51,000 mt), management actions have continually adjusted harvest levels downward to better match ecological needs. Reducing the current cap by up to 50% is the necessary next step to protect nursery grounds and support ecosystem-based management goals.

Preventing Harvest Spikes Through Quota Periods: Creating structured quota periods throughout the fishing season addresses the concentration of effort. Spreading harvest more evenly prevents intensive, short-term removals that disrupt forage availability during critical growth and migration windows for ecologically and economically vital species.

Supporting Regional Coastal Economies: Recreational fishing, ecotourism, and local commercial fisheries in the Chesapeake region depend directly on healthy populations of predator species. Ensuring adequate forage availability supports the broader coastal economy beyond the single commercial reduction fishery sector.

Recommendation

I urge the Board to adopt the maximum proposed cap reduction of 50% and implement seasonal quota periods to prevent intense harvest bursts. Precautionary management in crucial nursery habitats is essential to ensure resilient fisheries and a healthy marine ecosystem for generations to come.

Thank you for the opportunity to comment and for your continued commitment to sustainable ecosystem management.

Sincerely,
Jonathan Geary

I support reducing the Chesapeake Bay reduction fishery cap by the full 50%. The Bay is the primary nursery ground for Atlantic striped bass, and menhaden are a cornerstone of their diet. With the striped bass stock still struggling to rebuild, leaving more forage in the Bay is a low-cost, precautionary step that gives young fish the best chance to grow and survive. Menhaden also sustain ospreys, weakfish, bluefish, and other predators that depend on the Bay, and concentrating industrial harvest in a single nursery estuary puts all of them at risk of localized depletion. I also support dividing the cap into quota periods so harvest isn't concentrated in the spring and summer, when predators need forage most.

Please reconsider the reduction of taking menhaden in BOTH the CHESAPEAKE BAY and the Atlantic Ocean. There is documented evidence that the Osprey population and reproduction rates this year are well below the averages as a resource due to no menhaden to feed on and feed their young.
Additionally, so many species in both the ocean and bay areas depend on the menhaden for food.
Not to mention the bycatch that the Omega fleets are removing from the ocean during their netting operations. American Shad are being removed during these massive netting along with other ocean species. Restoring American Shad population is a key factor on the health of our River estuaries.

These Omega fleets are Killing our oceans by removing a vital fish that other fish depend on for food.

Please stop this raping of our oceans. If this process continues so will go the entire ecosystem and fish populations will plummet to levels that cannot be recovered.

The commercial harvest of menhaden is the Chesapeake must be curtailed. I spend a large portion of my summers fishing the east coast and I've personally seen menhaden stocks falling off precipitately. This is conjunction with stripped bass stocks that are nearing a state of rapid decline will result in major economic impacts to the region. The short term gains from overharvesting of menhaden stocks are not worth the multi-decade impacts to the fisheries.

Prefer option B with maximum reduction of 50%. Also, with even length of periods but uneven harvest, the 25%, 25%, 50%, B2 scenario. Most food would be available for both fish and birds during breeding periods. Reduces depredation of YOY for all species.

Overall comment: this is a horrible fishery in a bay environment, aided by very effective technology that ensures maximum kill rate of food source. Also, no evaluation or consideration of bycatch implications. Fish kills from netting activity need to be better monitored and restricted. No impact on the industry from multiple documented red drum fish kills in 2022 in the lower Chesapeake. How many more have occurred that aren't reported?

We have lost Osprey locally this year after the numbers were finally coming back. Overfishing commercially, lack of serious protection of the estuaries and waters of the coast and lack of support from agencies to aggressively defend overpopulation of fragile ecosystems is causing a perfect storm of resource degradation We seem to be the only species to willingly and knowingly destroy our own habitats in the name of greed and power. We need to be responsible and intelligent about further growth, and how we use our natural resources. Man cannot create natural resources, what is here is it. Let us not in our arrogance think it cannot happen or that we can “fix” it. Once gone it is gone and life as we love it will never be the same.

I'm in favor of reducing the catch in the bay so that larger fish populations can recover. I am convinced that the bay was intentionally depleted during the 90's. If the county wants jobs, look into data centers, and reducing staff. If the feds can cut back on bureaucracy so can we.

Two-three years ago the Menhaden (Bunker) in and near the coast of Raritan Bay to Manasquan we observed abundant and large schools on a regular basis especially at the end of our season Oct/Nov. In this same timeframe in the Shark River we observed abundant and large schools of Peanut sized bunker as well.

This year 2026 is concerning because we may have seen a school a few times in the Raritan and off the coast to Manasquan and the peanut bunker schools in the Shark River is also sparse.

This is within the 3 mile or just beyond.

As a budding scientist in the field of fishery and conservation ecology, I support this addendum. Quota dispersal within a season has been successfully implemented within other high-value Atlantic fisheries (the multispecies ground fish, scup, and mackerel fisheries for example — see NOAA management regulations). Besides being an economic target, menhaden are also ecologically valuable, occupying the role of forage fish upon which many other trophic levels rely on. This includes stocks important to sport fishermen like Black Sea bass (Chagaris et al., 2020). Therefore, I reducing the commercial cap would both act to preserve menhaden populations, and to bolster the populations of many other species iconic to the Bay, like striped sea bass, osprey, and others. These fish provide a key ecosystem service and for a truly sustainable fishery, regulations must benefit the entire system, both commercially and ecologically, which I believe this addendum will do.

Chagaris D, Drew K, Schueller A, Cieri M, Brito J and Buchheister A (2020) Ecological Reference Points for Atlantic Menhaden Established Using an Ecosystem Model of Intermediate Complexity. Front. Mar. Sci. 7:606417. doi: 10.3389/fmars.2020.606417

Being an avid saltwater sportsman, I am advocating for a reduction in the Atlantic Menhaden harvest. Being on the water several dozen times each year primarily in the NY bight area in New Jersey and New York, I have noticed a severe decline in the number of bunker pods. This has resulted in a diminished fishery in regards to the Striped Bass, fluke and bluefish, in addition to the strain it has placed on the shorebirds like the Osprey who have been identified as struggling to maintain their fledgling's particularly along Island Beach State Park. For the first time ever, I have noticed the Osprey catching immature dogfish as a food source for their offspring.
The reduction in this fishery has also placed a strain on the New Jersey recreational fishing industry which collectively have provided over $867 million in revenue in 2021.
I am an active member in the Jersey Coast Anglers Association and Sandy Hook Bay Anglers and fully support their proposal to Draft Amendment II.

I support the 50% reduction in what Omega is allowed to harvest, although 50% less than they're already taking is still too much.

I am submitting my preferences regarding the Atlantic Menhaden Draft Addendum II. In view of the 2026 disastrous breeding season for Ospreys in the Chesapeake Bay, I prefer the following options:
Section 3.1: Option C1e and C2a, which would reduce the Bay Cap by 50% with limits of 13.6% of the TAC and which sets an upper limit of 51,000mt for the Bay Cap
Section 3.2.1: Options B2 and B, calling for a quota period of even length and uneven harvest and establishes quota period overage payback and rollover of unused quota within a fishing year
Section 3.3: Option B, calling for the Bay Cap to be revisited every three years.
If I were able to vote for an immediate closure of the menhaden reduction fishery, I would. According to the Center for Conservation Biology at William and Mary, the 2026 season was the worst ever recorded for breeding Ospreys in the Chesapeake Bay and that a prime factor was food stress. It is imperative to stop this decline at once. I urge the ASMFC take stronger action as soon as possible.

I urge you to adopt the 50% deduction in the cap on menhaden fishing. Data from e-bird and other sources clearly shows a correlation between osprey population reduction and overfishing of menhaden in the Chesapeake bay.

I strongly support NO reduction fishery in the bay. A 0 Bay Cap as the bay is a wildlife nursery and should be ultimately protected as such. In light of that i am asking the ASMFC for the following.

Section 3.1 Bay Cap Amount: Options C1e (reduces the Bay Cap by 50% and then links it to the Coastwide catch limit at a 13.6% proportion) AND option C2a (Upper Cap limit of 51,000mt and no lower limit)
Section 3.2 Bay Cap Distribution: Options B2 (3 even length/uneven harvest quota periods 25%-25%-50%) AND Option B (establishes quota period overage and underage provisions)
Section 3.3 Bay Cap Revisit Provision: Option B (revisit the Bay Cap every 3 years)

Thank you for allowing me to comment on the Atlantic Menhaden draft addendum II. For 3.1, bay cap, I select option B4. 50% reduction in bay quota. For 3.2.1 option B1, three quota periods. for 3.2.2, option 1, any underage in period 1 gets rolled equally into the remaining periods. Last, the health of this fishery should be revisited every three years for stock evaluation.

Thank you for addressing this critical issue. I strongly support the most conservative management measures proposed in Draft Addendum II, including the maximum reduction of the Chesapeake Bay reduction-fishery cap and restrictions designed to prevent concentrated harvest during the peak summer period.

As a recreational fisherman who fishes regularly in Long Island Sound, I have personally observed a significant decline in the availability of menhaden. While I recognize that the Commission's current scientific data are not sufficient to definitively quantify the extent to which the reduction fishery is responsible for broader changes in menhaden abundance and distribution, that uncertainty should argue for precautionary management—not for delaying action.

Menhaden are a critical forage species supporting striped bass and numerous other fish, birds and marine predators throughout the Atlantic ecosystem. The potential consequences of removing large quantities of forage fish during concentrated periods can extend well beyond the immediate location of the fishery. Given the documented concerns regarding menhaden availability in Chesapeake Bay, the decline in certain fishery-dependent indicators, and the decline observed in the Choptank River survey, I believe it would be unnecessarily risky to maintain the status quo while waiting for additional scientific certainty.

I also believe the economic analysis should more fully recognize the economic value supported by healthy menhaden and the recreational fisheries that depend upon them. The economic impact of reducing the commercial reduction fishery should not be evaluated solely through jobs and output associated with harvesting menhaden. A meaningful analysis should also consider the businesses, jobs and coastal communities supported by recreational striped bass fishing and other fisheries that depend upon menhaden as forage—including charter boats, guides, marinas, tackle shops, boat dealers, fuel docks, restaurants and tourism.

Accordingly, I support the most restrictive Bay Cap reduction under consideration, along with meaningful seasonal quota controls that prevent disproportionate harvest during the peak summer period. I also support establishing a mandatory three-year review so these measures can be evaluated and adjusted as better scientific information becomes available.

This approach recognizes the legitimate economic interests of the commercial fishery while also recognizing that the long-term economic and ecological value of a healthy menhaden population extends far beyond the reduction fishery itself. Where the consequences of forage-fish depletion could be widespread and potentially difficult to reverse, precautionary management is warranted.

The most bet abundant commercial fishing of Menhaden using spotter planes is a real issue. It removes whole populations at scale which is beyond the replenishing capability of normal breeding cycles. The knock on effect on other east coast species is real and can be felt by recreational anglers.
The adjustment of the cap is required to protect this immediately

The Menhaden catch should be reduced by at least half if not more. Without a proper understanding of the menhaden population, you have no business setting high catch limits that are not known to be sustainable. The signs of ecological and food web declined are blinking red. Osprey are noticeably in trouble, and industry Menhaden catch is dropping seriously already.

A 50% catch reduction is prudent without a proper population study. Menhaden is a keysone species that could potentially collapse the Bay ecosystem. Please be very careful in protecting it.

Comment

I am requesting that the proposed reduction in the menhaden harvest cap be increased to substantially more than the proposed 50% or implement stronger restrictions such as a 5 yr moratorium.

Osprey have experienced extremely high reproductive failure in our region. A Stockton University research study has documented failure rates exceeding 80%, consistent with observations made firsthand by myself and others who closely study this species.

This past summer, I watched a newly established osprey pair nesting on an electric pole approximately one mile from the ocean. Although the pair mated and remained at the nest throughout the season, they did not successfully raise any offspring. I observed the birds hunting throughout the day, frequently returning without a fish or with catches so small that they could not reasonably provide sufficient food for the pair.

Osprey are competing for the same menhaden resource that is being harvested on a large commercial scale. They cannot compete with spotter-plane-assisted commercial fishing operations that locate and harvest menhaden from Virginia through the New York Bight.

The issue extends beyond osprey. Menhaden are a foundational forage fish, supporting a much broader marine ecosystem. Commercial fishing operations, including Omega Protein and others, are placing significant pressure on menhaden stocks along the East Coast. Declining availability of this essential forage fish affects osprey, whales, and numerous other marine species.

I respectfully ask regulators to adopt a substantially more conservative harvest cap and prioritize the recovery of menhaden populations and the health of the ecosystem over maximizing commercial harvest. Giving these forage fish populations an opportunity to rebound would benefit the entire marine food web.

Please take meaningful action to protect this critical resource and ensure that commercial harvest does not undermine the ecological needs of the species and communities that depend upon menhaden.

I've been fishing the Chesapeake bay for about 25years now. Fishing is my passion. I probably fish the bay around 100 times a year. I have noticed a profound drop in my catch over the last 10 years. The last 3 have been horrible. I completely blame the over harvest of menhaden in the bay. If I could vote to stop Omega from fishing in the Chesapeake bay I would! Since that is not a choice I would support the C1e, the 50% reduction of their harvest. Menhaden needs our protection now!!

This comment is in support of reducing the fishing cap for menhaden in the Chesapeake Bay by 50%. I live in Connecticut and we have seen the steady decline of the ability of osprey to feed their young, especially over recent years. In this respect, the losses in Connecticut are similar to those seen in other Atlantic Coast states. Osprey feed heavily on menhaden, and these small fish are now collected in industrial amounts in the Chesapeake Bay by Omega Protein, a subsidiary of the Canadian corporation Cooke, Inc., and its fishing partner Ocean Harvesters. They use enormous nets and every possible technological technique to locate where the bulk of these fish are. Individual fishermen, not part of this massive partnership, are seeing the effects; menhaden collection by individuals, who use them for bait, is down over 70%. The loss of young osprey, because they can not be fed by the adults because there is not enough fish, is bad not just for ospreys, but is an urgent warning. Many fish depend on these small fish for their food source, and it will not be just ospreys whose populations will drastically decline. In the short term, pleasing Omega Protein and keeping its jobs will be good for those that have them, but in soon everyone will be affected as the industry continues to scour the Chesapeake Bay for fish to make fishmeal. These small fish matter more to most of us than we know., and we should protect them more.

I am writing to request, with urgency, that the commission reduce the fishing cap on Atlantic Menhaden by at least 50%.

As a member of the Friends of Cape Henlopen State Park, I joined many in mourning the failure of yet another osprey clutch. We watched the failure unfold on the Park's webcam, which allowed us to witness the lack of food and the horror of chick starvation.

Of additional concern is the fact that the captains of Cape Water Taxi and Tours have told me that they are finding it harder to find dolphin schools during their sunset dolphin tours. One captain attributed the difficulty to the likelihood that the food sources in the usual locations were causing to dolphins to travel further to find food. He told me last Friday "They don't have enough to eat."

The same captain, who is also a commercial fisherman, noted that on many overnights he sees menhaden fishermen in the water for most of the night. These fishermen don't acknowledge other boats, leading the captain to think they might be operating illegally.

We don't need to waste our natural resources on licenses to Omega Protein, which Canadian vacuums up scores Menhaden

for fish oil supplements.

Please consider the evidence and take steps to protect this vital species before it is too late.

Thank you.

Connecticut

Comment

Dear Board Members, my name is Michele Millham and I am a volunteer osprey nest monitor for the Connecticut Audubon Society's Osprey Nation project. For over five years I have been tracking the breeding success or failure of osprey nests in my community.

This month, eight of the nine nests I monitored had chicks that did not survive to fledge from the nests, well above the failure rate from any of the previous five years. I recognize this is an anecdotal observation, but it is in line with similar observations from across the entire eastern seaboard as well as the scientifically collected data that is emerging showing that osprey are unable to find enough food to support their young.

The most likely culprit is a marked reduction in fish stocks, most notably the population drop of Menhaden (bunker). Osprey and other wildlife depend on bunker as a key source of high quality nutrition for both them and their young. Whatever may be the cause of the drop in bunker population, we need to act now to stop a catastrophic population crash of this keystone fish species. We cannot wait for the population to fully crash before making changes because it will then be too late to rescue the species in a meaningful way.

The changes I am calling for include the implementation of stopping or significantly reducing the fishing of Menhaden/bunker while, in parallel, conducting the scientific research necessary to understand the pressures on this population of fish. Indiscriminate harvesting of bunker must stop.

Our ecosystem is giving us very clear warning signals. We need to listen and act to protect our resources as soon as possible. Over 50 years ago, osprey were one of the sentinel species that alerted us to the dangers of DDT. The decision makers listened then and species such as the bald eagles and osprey recovered. Now the current leaders such as this board need to listen to what the osprey failures are telling us and act now to forestall a crash of the ecosystem-critical Menhaden/bunker. We are depending on you to do the right thing.

Thank you.

I am advocating for the strongest menhaden protection alternatives considered by Draft Addendum II. This is long overdue. Those which I support include:

Section 3.1 Bay Cap Amount:
Options C1e (reduces the Bay Cap by 50% and then links it to the Coastwide catch limit at a 13.6% proportion) AND option C2a (Upper Cap limit of 51,000mt and no lower limit)

Section 3.2 Bay Cap Distribution:
Options B2 (3 even length/uneven harvest quota periods 25%-25%-50%) AND Option B (establishes quota period overage and underage provisions)
Section 3.3 Bay Cap Revisit Provision:

Option B (revisit the Bay Cap every 3 years)

The Osprey population is starving and unable to reproduce enough to sustain their population. Menhaden has been over harvested in Virginia for so many years, and it has caught up with us. Don't allow human greed to lose the Osprey population. All menhaden harvesting should be stopped in order to evaluate before we lose this keystone species.

I support the following options in Draft Addendum II:

3.1 Chesapeake Bay Reduction Fishery Cap Amount: Support option C1e that would reduce the Bay Cap by 50 percent and limits it to 13.6 percent of the Coastwide Catch Limit (TAC). Also, support option C2a which sets an upper limit of 51,000mt for the Bay Cap, which is the current level.

3.2 Chesapeake Bay Cap Distribution: Support option B2 which establishes three even length quota periods for the Bay Cap, but distributes harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. Also, support option B which establishes quota period overage payback and rollover of unused quota within a fishing year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: Support option B Revisit Provision to reassess the efficacy of these new management tools every 3 years.

The Ospreys are steadily declining due to overfishing of Atlantic Menhaden. Overfishing has to stop.... these birds need Atlantic Menhaden to survive, and feed their chicks so that they survive!

It's time to pause or restrict over harvesting of Atlantic Menhaden. Overfishing of menhaden is increasingly hurting Chesapeake Bay fish. This year's breeding season for osprey was the worst to date. 80% of nesting osprey pairs failed to fledge any young due to overfishing of Atlantic Menhaden in the Bay. Menhaden populations affect more than just Osprey, but it is devastatingly clear that something needs to be done immediately to save this population and the complex web of ecology they are a part of. This is a clear warning sign and there is a clear answer-- Pause or restrict Atlantic Menhaden harvesting. Stop giving corporations free rein to take whatever they want in their quest for ever increasing profits. Please act to address this problem now.

Stop letting these corporations destroy our ecosystems. When the Chesapeake Bay dies, we are talking about a trillion dollar loss to the economy. I know for a fact that you aren't getting billions in taxes from the commercial harvest, so how can you justify this? In pure economic analysis, we are making a catastrophic mistake. The ripple effects are still being studied and it might soon be too late to stop it.

Regulation of the menhaden fishing industry is not an anti-business approach, rather a sustainable approach. A healthy menhaden population in the Chesapeake Bay will not only ensure the persistence of Osprey and other fish-eating birds, but also the menhaden fishing industry and jobs.

Do not remove menhaden from the bay! It's a fragile ecosystem with many factors contributing to habitat loss. Sucking the menhaden out, in addition to all the breeding-sized fish that are killed in the process, does not help the Bay, or Virginia. Roughly 26% of all seafood goes to waste in the United States. I'm sure with all that, there are plenty of other ways to make fish pellets. Don't take a primary source of food to manufacture salmon that will likely also be wasted.

As someone who goes fishing in the Long Island Sound several days a week, the decrease in the number of Menhaden has been noticeable and concerning. It was only a few years ago that one could observe several large schools of these fish from early summer through fall. As of the end of September 2026, I have yet to see a single school of these fish. As a result, fish like Striped Bass and Bluefish have not been as abundant and one can not even buy Menhaden for bait in the tackle stores because there is no supply. I am in full support of the maximum reduction in quota for the commercial Menhaden fishery.

Virginia's Chesapeake Bay Osprey and Royal Tern populations are and have been negatively impacted by the over-harvest of menhaden. Having been involved in decades of field studies of both species, I have witnessed first hand menhaden harvest, and over time, the slow downward decline of successfully breeding Ospreys. Virginia Tech studies of Virginia's Royal Tern colonies provide evidence of the importance of menhaden for reproductive success.
Osprey productivity has fallen below long-term population sustainability. This is directly associated with lack of food for young, in this case menhaden.
I urge a strict moratorium on menhaden harvest in the Chesapeake Bay and from Virginia off-shore waters.

As a Charter Captain on the Chesapeake Bay that fishes from Annapolis to Cape Charles, I strongly support amendment II. Changes in menhaden population over the past few years is something noticeable throughout the entire bay. I can't continue to make a living here on the Bay if the most important baitfish is depleted to a level that no longer supports other marine life.

As a Tri-State Bird Rescue volunteer, I see first hand the devastating effects that overfishing of menhaden has on the Sussex county Delaware Osprey population. The few young that make it to fledgling size are starving! This year, more than once I have rescued a juvenile Osprey and quickly realized that it was emaciated, with the keel easily felt, almost sharp like a knife - not normal! The situation is desperate. Menhaden meet the dietary needs and are the preferred fish for Osprey. The situation is dire!

Dear ASMFC,

As a lifelong resident of the Chesapeake Bay watershed who grew up by the Bay, I am writing to urge you to reconsider the current practice of industrial reduction fishing for Atlantic menhaden in the Bay. Menhaden are a crucial part of the Bay ecosystem and food web, and their reduced numbers are contributing to population collapse for ospreys and other species. Ospreys are an icon of the Atlantic coast. The estimates that over 5,000 osprey chicks per year are starving to death from lack of food are just unfathomable. I'm not asking you to wipe out the industry, just to relocate it outside the Bay to where the ecosystem is under less stress than the heavily developed Chesapeake Bay watershed, or at least pause the fishery in the Bay long enough for long overdue study of the issue.

I can't imagine a world where my kids grow up without ospreys on the Bay, but that's where we're headed without action. Thank you for your consideration.

Sincerely,
Tyler Demetriou

We live on the Bay in Jamesville VA. We have watched our osprey nest fail and spoken to many friends and neighbors here and on Hungars Creek say the same. We also used to see dolphin every day. Usually twice a day and this past year almost never. We have seen omega Protein so close to our shore, I felt I could walk to the ships. That time, during the 4th of July weekend, their nets broke sending hundreds of dead fish to the shores where our paying tourists were trying to enjoy their holiday. Tourism is one of the biggest incomes for our Northampton County. We dont obtain income from Omega Protein. We need our Bay healthy for our sports fishers and for our tourists and also just for us - the people who live here year round. Many have worked hard to " clean up the Bay" in so many ways. It is devastating to us to see it being sold in this way. Please look at the Chesapeake Bay as a separate entity when it comes to ypur scientific studies. It is unique. It is special. We can all co-exist but , in my opinion, Omega Protein has a much bigger share and take. When the menhaden are gone, so are many other creatures along with Omega protein interests and definitely ours. Please dont let them buy the Bay. Its a resource that should belong to all of us and be used in a caring manner deserving of such a one of a kind system. Thank you.

I urge all reading to please pass any and all measures to help protect the menhaden population.

First, from an environmental perspective, this species is critical to supporting the entire Atlantic marine fishery as a whole. Without the fish, the impact to the ecosystem could be devestating.

Due to the above fact, the collective long-term well-being of both the commercial and recreational economies depends on the well being of the menhaden stock.

Let us all work together on this to preserve our incredible fishery for our children, their children, and the generations to come.

I think all menhaden fishing should be done 3 miles off the shore in the ocean. Common sense says taking Manhattan in the bay is just hurting the recreational fishing and ecosystem of the bay.

Have seen very few menhaden balls in the oceanfront this year. Bluefish striper and speckled trout blitzes at the beach are nonexistent.

Re: Managing menhaden for the health of the Chesapeake Bay and the Atlantic coast

Menhaden are one of the most important fish on the Atlantic Coast. They are vital as a food source to the birds and fish that call the coast home.

3.1: Options C1e and C2a. I support a precautionary reduction in the Bay Cap by 50% .
3.2: Option B2. I support the establishment of three quota periods for the Bay Cap at a 25/25/50% harvest distribution percentage per quota period. This will help reduce food competition for birds like osprey
3.3: Option B I support reviewing the Chesapeake Bay Cap every 3 years.

As a recreational fisherman, I can clearly see the reduction in menhaden numbers. Gone are the vast shoals of fish and I get excited to see even a medium size school. This has knock on effects up and down the ecosystem as demonstrated by the huge die off of osprey chicks this year. Fish and wildlife will recover if we give them a chance, but fishing them to oblivion leaves nothing for the future. Please reduce the commercial catch immediately before the fishery is destroyed for decades to came.

We humans have been very successful and efficient in decimating and wiping out entire species. Again, we are on a downward spiral to ensure the Menhaden, along with collateral damage of other species are in jeopardy.

Quotas are established on commercial fishing, but they are not enforced and the violators are not fined when they exceed their quota.

Political contributions and greed drive the decision-making/enforcement process, not science.

Certainly, we can place higher priorities to conserve and protect natural resources than manufacturing cat food, cosmetics and fish oil at the expense Menhaden and the interlinked species.

Presumably, the Commission will take bold steps to rebuild Menhaden populations. However, in doing so, local jobs will be lost resulting in severe impacts to the economy of Virginia's Northern Neck. It is only fair and reasonable that a program be developed to compensate and assist employees who are adversely impacted. A good example of such program is the Tobacco Transition Payment Program, entirely funded without tax dollars.

Having lived along the Chesapeake bay most of my 59 years, I can see the dramatic toll cemercial menhaden fishing has had on one of the worlds most important ecosystems. The harvest of millions of tons of bait fish annually that species like Striped Bass and many others rely, including Virginia's sea birds, has already caused great harm to Virginia waters. It's time Virginia places the environment ahead of a foreign owned company and kicks them out of state waters, like every other east coast state has already done.

I have experienced a decline in nesting and successful hatching at my home on the James River. Several years ago we purchased a home on the North River in Mathews VA and were excited by the prospects of better results. There are two nesting stations. One hasn't been occupied in three years and the other has had no successful hatching. I fully support efforts to decrease menhaden removal from the bay and its estuaries.

The Menhaden population in NJ has been decimated by these reduction boats... Ospreys are only one of dozen of local species that have been severely damaged by this Menhaden Reduction Fishery. It has been affecting Rec. Striped Bass Fishing, REC. Bluefin Tuna Fishing. Weakfish , Flounder , Seabass , And on & on

There has been a definitive decline in bunker along Long Island and New Jersey shorelines.
The only way Striped bass and other fisheries will survive is to have bait fish, mainly Menhaden.
When you loose one bait, others will start to get consumed more frequently. It's just natural. However, we are seeing more oceanic fish in close to shore looking to feed. It doesn't take a college degree to realize that baits are being overfished.

Comment

The mass overfishing of menhaden inside the Chesapeake Bay needs to be stopped, and a strict boundary several miles OFF of the Atlantic coastline established, immediately. There should be NO spotting planes/drones allowed, and adjustments to nets made to ensure only full-sized adults are caught.

Foreign commercial fisheries are inside our territorial waters, specifically INSIDE the Bay, and they are literally vacuuming up all aquatic life in the Bay to harvest these fish –menhaden. This is causing permanent, crisis–level damage to fishery stocks, as well as a dramatic decline of osprey populations. Menhaden are the foundation of the food web for the entire region, and when the bottom rung collapses, the entire ecosystem will deteriorate.

For the last several years, ospreys have been disappearing from the Bay, and those that have managed to find enough food to have eggs and reproduce have seen a well-above/average death rate of those chicks due to starvation. Menhaden is their primary food.

It is not only the ospreys and the bald eagles that will starve and disappear. The economy of so many people in the Bay region is based on recreational fishing as well as commercial (at a smaller scale) fishing. Blue crabs, bass, are all based in the

Chesapeake Bay.

Just like fishing off of the Grand Banks in the upper northeast of the United States had to be stopped and regulated in the 1980s to ensure the long-term survival of commercial fish populations, so does the excessive depletion of the Chesapeake Bay fish stocks needs to be stopped until there is a solid study done.

Thank you.
Julie Kelly

I support the strongest conservation measures available in Draft Addendum II, specifically:

3.1 Chesapeake Bay Reduction Fishery Cap Amount
- Option C1e: To reduce the Chesapeake Bay CAP by at least 50 percent in 2027 and link any changes to the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).
- Option C2a: To set the maximum upper limit in any future change at the current level of 51,000mt.

3.2 Chesapeake Bay Cap Distribution
- Option B2: To establish three even length quota periods for the Chesapeake Bay Cap, distributing the harvest at 25% in period 1, 25% in period 2, and 50% in period 3.
- Option B: Provides any underage of Quota Periods 1 or 2 be rolled into Period 3 of the same fishing year. Any underage in Quota Period 3 would not be reallocated. Any overages would be deducted from the same quota period in the following year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision
- Option B: Revisit the Chesapeake Bay Cap every 3 years.

I believe these measures are a good start, but they do not go far enough. My preferred long-term outcome is the complete elimination of commercial menhaden reduction harvest from the Chesapeake Bay.

Menhaden are a foundational forage species for striped bass, bluefish, red drum, cobia, birds, marine mammals, and countless other species. The Chesapeake should be managed first as a critical ecosystem and nursery—not as a source of industrial-scale forage removal for fish meal and oil.

I urge the ASMFC to adopt the strongest options in this Addendum as an immediate step, while establishing a clear path toward zero commercial reduction harvest of menhaden in the Chesapeake Bay.

Keep omega and any other large companies out of the bay. Our estuary should be off limits for these large ships with spotter planes decimating our natural resources. Furthermore other countries are buying our USA companies to make it seem as though we are behind this smoke and mirrors game . It is my understanding that a Canadian company is operating in reedville Va . Netting up menhaden and who knows what to feed their farm raised trout. Also Wanchese fish company , owned by Chinese. These companies have no business in our seafood industry. Keep them out of the largest estuary on the east coast. We are already seeing problems with their practices. Once ruined how do propose we feed our families with the overpopulation that is exploding already. David Elliott recreational angler of 50 years.

Whatever this board rules for it's being delayed far too long, the draggers are inflicting horrible damage to our ocean life and bird life. Bait fish are disappearing due to the over harvest allowed and the by-catch kill is ridiculous. Osprey chicks are starving at an alarming rate thanks to the Marine Fishery allowing this disaster that is allowed. I'm tired of hearing it's the sport fisherman, the charter boats reducing the Striper and Fluke population when metric tons of bunker are being scooped up and the by-catch being crushed and thrown overboard to die. A 12 mile safe zone isn't enough, too little too late, put a two to three year ban on the Omega draggers for the schools to rebuild and at that time enforce a 15 mile safe zone from Maine to Florida...

We need to be very careful and protect (filter feeders) menhaden. They are the foundation food for most of the fish, raptors and other species in our region. If we over fish them and they don't rebound we will loose many of the species that need them for survival all the way up the food chain.

I think that Reducing the initial Chesapeake Bay Cap by 50%, from 51,000 to 25,500 metric tons.
Establishing the Bay Cap at 13.6% of the coastwide total allowable catch so it can adjust when the coastwide quota changes.
Maintaining 51,000 metric tons as the maximum Bay Cap, with no fixed lower limit.
Allocating 25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period.
Requiring early-season quota-period overages to be deducted from the corresponding period during the following year.
Requiring ASMFC to revisit the Chesapeake Bay Cap and related management measures every three years.
Together, these measures would reduce the amount of industrial harvest permitted in the Chesapeake Bay, protect more menhaden during ecologically important parts of the year, and create a system that can respond to new science and future coastwide quota changes.

Question 5 — Option C: Link the Chesapeake Bay Cap to the coastwide total allowable catch.
Question 6 — Option C1E: Set the Bay Cap at 13.6% of the coastwide quota, initially equivalent to a 50% reduction from the current cap.
Question 7 — Option C2A: Establish 51,000 metric tons as the upper limit, with no lower limit.
Question 8 — Option B2: Allocate 25% of the Bay Cap to the first quota period, 25% to the second, and 50% to the third.
Question 9 — Option B: Require quota-period overage paybacks while allowingunused quota to roll into the final period of the

same fishing year.
Question 10 — No change.
Question 11 — Option B: Require ASMFC to revisit the Chesapeake Bay Cap every three years.
Question 12: I believe that the abundance and protection of menhaden in Chesapeake Bay is extremely important to not only me as a fisherman, but all species that live in on or around the Chesapeake Bay, all the birds of prey all of the Crabs fish turtles and everything in between that rely on Menhaden to thrive I've seen acres and acres of schools of Menhaden in the past when I was growing up and now in recent years, I only see small schools of peanut bunker and it is really sad because you can clearly see the correlation between the last bait. The last larger fish in this issue is larger than just fisherman. If the decline in the Menhaden species in the bay continues to decrease it will be an ecological collapse for all living species in and around the Chesapeake.

I along with others have watched Omega pillage the Chesapeake Bay for too long. To me a great recent example is the bi-catch discovered around cape Charles several years ago. The dead puppy drum found floating in the nearby bay waters is just one a many horrific damage Omega has inflicted on the bay's environment. Couple this with the harvested product most if not all leaves this country for Canada. TIME TO REIN OMEGA IN!!

I have not seen an adult bunker in seven years of fishing in my local tidal river. When the adult bunker are in this river it explodes with life. The herring numbers are also criminally low. This ricer has spawning locations for all types of fish and birds and mammals and reptiles that need the bunker to maintain its obviously simple ecosystem. Ban the harvest of commercial herring/bunker/shad. 100% ban the fishery. We are feeding our most important recourse to foreigners and turning them into food for domestic animals. It is an absolute heinous crime to allow a vessel to net these fish commercially. Even a cast net seems like overkill. 50% of the haul would be a start but o doubt it's enough to reverse the damage just ban the herring fishery. Ban the commercial fishery for herring. It is obviously ruining the Atlantic Ocean. I have not seen an adult bunker in SEVEN YEARS. Seven years! Not one adult bunker on a snagger hook not one school of bunker in the river while kayak 10miles of it on a regular basis there are zero adult bunker left. They are gone and never had the chance to come back. It is absolutely ridiculous that these fish can't make it back to the coast here. Ban this fishery it is absolutely the most absurd fishery in our country. It's like taking food from a baby. It's not fishing. It's as if these boats were going to Africa taking all of the food and leaving not a single scrap. Everything dies and leaves looking for a new food source. Allow the bunker to migrate to Connecticut before a spy plane and net the size of my state clears 50% of the population before it leaves home base. Lowering the haul to to 50% is not enough. Stop the fishery. These people who have boats and planes for this are not going to die of starvation. Their families are fine and their livelihood is not at risk. Our ocean and shoreline ecosystems however do not

have another option or source to recover from. It is not okay to be netting these fish commercially. It is not food for a human. This “omega protein” is not human protein. It is not something we need. These fish are being harvested for greed. Destroying the ecosystem of our ocean for the sake of cat food is unfathomable. Please do better.

I own a party fishing boat out of New Jersey. For the second year in a row I find myself asking where are the Bunker? Now I realize this is for the Chesapeake Bay cap. However I realize that many of the fish we see in New Jersey, arrive here from the Chesapeake.

Our own Delaware Bay no longer supports the abundance of Bunker it once did when I was younger for reasons unknown. We also have seen localized depletions of Striped Bass, Bluefish, Weakfish and Summer Flounder. What used to be a thriving bay of life is a bay of death. The water is so very clean from the abundance of oysters in the bay that were not present there thirty years ago it is difficult to understand why it no longer has the life that it once did.

I can say that the constant attention that the Omega Fleet has given to the mouth of Delaware Bay, particularly during the Bunker runs that normally result in spawning outside the Bay, right on Five Fathom Bank, possibly have decimated the mature Bunker necessary to provide the Bay with Bunker larvae. I'm not a scientist- that's your job.

I can tell you I feel NO ONE is looking into what is wrong with Delaware Bay. I support a reduction in the fishing being done by the Omega Fleet out of Reedville, VA. Localized depletion is exactly what the fleet is designed to do. Localized depletion is what the result of mile long seine nets causes. When this fleet arrives in our area, they run schools out of the three mile limit ,

then sit the vessel on the three mile line and extend the net inshore of the line so their AIS signature is legal- while their net is not. After the fleet departs Cape May, it can be weeks before we see any schools return.

This style of commercial fishing has affected our fishing. It has affected our whale watching. It has had negative affect on the nesting Osprey that have been thriving across Cape May County. So many Osprey Nests have failed in the past two years that we watch with our passengers as the chicks are two week to fly and then bed down and die in the Nest because they have nothing to eat. For the past two years the majority of Osprey I have seen in flight carrying a Bunker in their Talons, the fish was only the size of one Talon. Normally the Osprey pick up 6-10” Bunker and turn the fish to hold them head first with both Talons. The past two years they can only find fish 2-3” long which only fit in one Talon!

This localized depletion of Bunker is affecting the Bald Eagles in my area that also fish for Bunker. The Bald Eagles have turned to eating Laughing Gull chicks to survive. The Bald Eagle at least can adapt. The Osprey Cannot.

Please consider further study of localized populations of Bunker on Chesapeake Bay. Please consider a moratorium on Bunker Fishing at an industrial level. The fishermen in Cape May are not the problem- their landings do not result in the disappearance of Bunker. When they leave an area there are still schools leftover- that is the true mark of sustainable fishing. The Omega Fleet does result in the disappearance of Bunker for long periods of time. How is that considered sustainable. Sustainability should be the goal, not efficiency. This disappearance is not due to the migration of Bunker and has everything to do with picking up whole schools of mature spawning bunker and removing their ability to reproduce.

Thank you for your time

I own a party fishing boat out of New Jersey. For the second year in a row I find myself asking where are the Bunker? Now I realize this is for the Chesapeake Bay cap. However I realize that many of the fish we see in New Jersey, arrive here from the Chesapeake.

Our own Delaware Bay no longer supports the abundance of Bunker it once did when I was younger for reasons unknown. We also have seen localized depletions of Striped Bass, Bluefish, Weakfish and Summer Flounder. What used to be a thriving bay of life is a bay of death. The water is so very clean from the abundance of oysters in the bay that were not present there thirty years ago it is difficult to understand why it no longer has the life that it once did.

I can say that the constant attention that the Omega Fleet has given to the mouth of Delaware Bay, particularly during the Bunker runs that normally result in spawning outside the Bay, right on Five Fathom Bank, possibly have decimated the mature Bunker necessary to provide the Bay with Bunker larvae. I'm not a scientist- that's your job.

I can tell you I feel NO ONE is looking into what is wrong with Delaware Bay. I support a reduction in the fishing being done by the Omega Fleet out of Reedville, VA. Localized depletion is exactly what the fleet is designed to do. Localized depletion is

what the result of mile long seine nets causes. When this fleet arrives in our area, they run schools out of the three mile limit , then sit the vessel on the three mile line and extend the net inshore of the line so their AIS signature is legal- while their net is not. After the fleet departs Cape May, it can be weeks before we see any schools return.

This style of commercial fishing has affected our fishing. It has affected our whale watching. It has had negative affect on the nesting Osprey that have been thriving across Cape May County. So many Osprey Nests have failed in the past two years that we watch with our passengers as the chicks are two week to fly and then bed down and die in the Nest because they have nothing to eat. For the past two years the majority of Osprey I have seen in flight carrying a Bunker in their Talons, the fish was only the size of one Talon. Normally the Osprey pick up 6-10” Bunker and turn the fish to hold them head first with both Talons. The past two years they can only find fish 2-3” long which only fit in one Talon!

I was born and raised in the suburbs of Rochester, NY, and lived in Buffalo for over a decade. Looking to escape those brutal winters, I took a map, randomly picked 4 locations between Virginia and N. Carolina, got in my car and my first interview was with the Northumberland County School system. Upon receiving my job offer, I canceled all my other interviews because I had found a hidden gem that captured my heart so completely, I knew I would never leave.

Reedville is a tiny, historic fishing village where life is anchored by tradition. It is truly a unique place where hard-work and dedication center around Omega Protein. This community is comprised of some of the most kind, embracing people you will ever meet, whose lives and livelihoods are deeply intertwined with the Chesapeake Bay.

As an educator here, the heartbeat of this industry resonates in my classroom every single day. Throughout my career, there has never been a year where I did not teach children directly connected to the factory. The beautiful, cyclical nature of this place means that many of the sixth graders I taught 20+ years ago now work at the factory and today, I am blessed to teach

their children in kindergarten. This is generational hard work in action –a vivid, living picture of the quintessential American dream built on grit, calloused hands, and dedication to family.

But because this factory is the lifeblood of our county, our community exists in a delicate balance. The threat of a drastic cut to the menhaden quota looms large over our schools and our families. Imposing such a severe reduction is not just a regulatory adjustment; it is an economically devastating measure that will completely upend this tight-knit community, rippling through local businesses, families, and the school system itself.

A 40% reduction directly threatens the livelihoods of over 200 plant workers, captains, and crew members. In a rural area like the Northern Neck, the factory supports an entire network of local businesses –from fuel suppliers and maritime mechanics to the grocery stores where my students' families shop. Forcing a leaner operation or structural insolvency would decimate our local tax base, defund our schools, and destroy an iconic American working waterfront.

What makes this threat so painful is it is scientifically unwarranted. The push for this cut is driven by localized environmental anxieties rather than the best available coastwide science. Assessments by this very body have repeatedly shown that the Atlantic menhaden stock is not overfished, nor is overfishing occurring. The industry already operates under strict, cutting-edge Ecological Reference Points (ERP's) designed to leave a massive buffer of fish in the water for predators. Slashing the quota by any additional percentage bypasses this established scientific framework in favor of political pressure.

Furthermore, because Virginia is the only remaining state that permits an active reduction fishery, the disproportionate burden of this cut falls entirely on a single community. It ignores heavy conservation compromises the industry has already accepted –including the rigid 51,000-metric-ton cap inside the Chesapeake Bay.

Fisheries management must balance ecological health with human and economical survival. A rigid cut is a blunt instrument that ignores the health of the biomass, threatens domestic food security, and risks permanently extinguishing a historic, sustainable American industry. To protect this factory is to protect a rare, vanishing way of life.

I ask you to carefully consider both the rigorous science and the human component before making your decision. Please protect our families, our schools, and our community by voting against any reduction in fishing.

Thank you for your time and consideration.

I Ve fished the Chesapeake bay and rivers for many years. I see less fish and bait every year. It makes no sense except over harvesting of the bait fish. Why would you allow this nursery for many species to be fished at all. Maryland stopped years ago Virginia needs to do the same. The water quality has improved but the water fish and bait are not there as in the past. The striper all vey skinny until the fall of the year. No reason for this except not enough food. Manheden have been overfished up and down the coast. There used to be huge canneries up annd down the coast all are gone because of depleted stock. Industry can't get catfish and carp for fertiliser and leave these fish to support many species and wildlife. Time is running out as we've seen with other species that used to be prevalent and now so scarce.

I fully support to addendum to cut the fishery cap by 50%. I'm only 26 years old, and in my lifetime of fishing the bay I have seen a significant decrease in menhaden schools and find them completely absent from areas they once filled. The food chain of the entire bay is held up by menhaden. The terrible Blue crab and Striped bass numbers (two critical species for Maryland's economy and tourism) are surely linked to menhaden depletion, yet the finger always gets pointed elsewhere.

Public Comment Regarding Chesapeake Bay Menhaden Management

I respectfully submit this comment in support of a temporary 50% reduction in menhaden harvest/consumption in the Chesapeake Bay while a comprehensive, adequately funded ecosystem and socioeconomic study is conducted.

My position is not that commercial menhaden fishermen are the problem, nor that the available science proves that reducing menhaden harvest will automatically increase recreational fish populations. The issue is that the Chesapeake Bay is an exceptionally important and complex ecosystem, and the economic and ecological consequences of menhaden management extend far beyond the menhaden fishery itself.

The need for better Chesapeake Bay–specific research

Menhaden occupy a uniquely important position in the food web. They are harvested commercially while simultaneously serving as forage for striped bass, red drum, cobia, bluefish, weakfish, birds, marine mammals, and numerous other predators.

The central question should therefore not simply be whether the existing menhaden stock is considered sustainable in isolation. The more important question is whether the current level of removal is appropriate within the Chesapeake Bay ecosystem, particularly given the economic importance of recreational fishing.

Existing socioeconomic information also does not appear to fully capture the economic activity associated with recreational fishing throughout the Chesapeake Bay. Commercial menhaden harvest has a measurable and important economic contribution, but so does recreational fishing—and the economic chain associated with recreational fishing extends well beyond the person holding a fishing rod.

A comprehensive study should examine:

Menhaden abundance and distribution within the Chesapeake Bay
Menhaden spawning and recruitment
Predator-prey relationships and forage requirements
Striped bass, red drum, cobia and other predator populations
Commercial menhaden harvest and its economic contribution
Recreational fishing participation and expenditures
Chesapeake Bay charter captains and fishing guides
Tackle shops, marinas, boat dealers, fuel suppliers and other fishing-related businesses
Restaurants and hotels that benefit from fishing-related tourism
Regional employment and tax revenue generated by recreational fishing
The economic consequences of both increasing and decreasing menhaden harvest

This should be a Bay-specific ecosystem and economic assessment, rather than relying primarily on generalized assumptions about menhaden abundance or economics across the broader Atlantic region.

Why a temporary 50% reduction is reasonable

A 50% reduction should be viewed as an interim precautionary measure—not a permanent determination that commercial menhaden fishing is unsustainable.

Reducing the current Chesapeake Bay menhaden cap from approximately 51,000 metric tons to approximately 25,500 metric tons would provide an opportunity to evaluate whether increased forage availability produces measurable changes in predator populations, distribution, recruitment, and recreational fishing success.

Importantly, this approach creates an opportunity to learn.

If the study demonstrates that the reduction produces little or no measurable ecological or socioeconomic benefit, management can be reconsidered based on that evidence.

Conversely, if the reduction produces measurable improvements in predator abundance, recruitment, fishing success, or recreational economic activity, managers would have meaningful evidence to support maintaining a lower harvest level.

That is preferable to making a permanent management decision without first obtaining the information necessary to understand the full consequences.

The commercial fishing perspective must be considered

Commercial menhaden fishermen and the communities dependent upon them should not be dismissed in this discussion.

A significant reduction in harvest could have real consequences for commercial operators, employees, processing facilities, suppliers, and communities that depend upon the fishery. Those impacts deserve to be quantified and considered alongside the potential ecological benefits.

However, the same standard should apply to the recreational economy.

A Chesapeake Bay charter captain does not operate in isolation. His or her economic activity can support marinas, fuel purchases, tackle sales, boat maintenance, lodging, restaurants, transportation and other local businesses.

Maryland alone has historically documented hundreds of Chesapeake Bay charter captains, illustrating that the recreational fishing industry represents a substantial economic sector. The broader economic footprint—including Virginia, Maryland and the businesses that support visiting anglers—deserves comparable attention in management decisions.

Recreational fishing represents more than the value of a fish

One of the most important considerations is that recreational fishing has an economic multiplier effect.

A successful recreational fishery can generate spending on:

Charter captain → boat/fuel → marina → tackle → bait → restaurants → hotels → transportation → local businesses

The value of the fish caught is therefore only one component of the economic benefit.

For example, trophy-fish citation records in Virginia over the 2006–2025 period document thousands of qualifying catches involving species such as striped bass, red drum and cobia. These records should not be interpreted as proof that menhaden management caused changes in those populations; citation numbers are not a population-abundance index. They do, however, demonstrate the existence of a significant recreational fishery and provide one potential source of historical information that could be incorporated into a broader socioeconomic and fisheries analysis.

This does not have to be commercial versus recreational

I believe this issue is being framed too narrowly when it is characterized as a conflict between commercial fishermen and recreational fishermen.

Both industries have legitimate economic interests.

The better question is:

What level of menhaden harvest provides the greatest long-term benefit to the Chesapeake Bay ecosystem and the people whose livelihoods depend upon it?

We should not have to choose between commercial fishing and recreational fishing based on incomplete economic information.

Instead, management should obtain the data necessary to determine how the ecosystem and both economies respond to different harvest levels.

Request

I respectfully request that management:

Temporarily reduce the Chesapeake Bay menhaden harvest/consumption cap by 50%, from approximately 51,000 metric tons to approximately 25,500 metric tons.
Provide substantial additional funding for a comprehensive Chesapeake Bay–specific ecosystem and socioeconomic study.
Measure both commercial and recreational economic impacts, including charter captains, fishing guides, marinas, tackle businesses, restaurants, hotels, tourism and associated employment.
Monitor menhaden abundance and distribution as well as predator species, including striped bass, red drum, cobia and other important forage-dependent species.
Establish measurable benchmarks and a defined review period so that the temporary reduction can be evaluated objectively.
Use the results of that study to determine future menhaden management, rather than allowing either commercial or recreational interests to determine the outcome based solely on economic or anecdotal arguments.

The goal should not be to eliminate or permanently restrict a legitimate commercial fishery. The goal should be to ensure that we have enough information to manage one of the Chesapeake Bay's most important forage species responsibly.

A temporary 50% reduction combined with a properly funded, independent and comprehensive study would allow us to protect the resource while also protecting the economic interests of the people who depend upon it.

We should not be forced to choose between commercial fishermen and recreational fishermen when better science and better economic information could allow us to make a decision that considers both.

Thank you for considering this comment.

Comment

I support the 50% reduction option for the Chesapeake Bay reduction-fishery cap, provided that it is implemented as a precautionary interim measure while a comprehensive, adequately funded Chesapeake Bay-specific study is conducted.

I want to acknowledge the legitimate economic concerns of the commercial menhaden industry. Menhaden fishing supports an important regional industry, particularly around Reedville, Virginia, and commercial fishermen should not be expected to absorb regulatory changes without consideration of their economic consequences.

However, I believe the same standard needs to be applied to the recreational and charter-fishing economy.

ASMFC's own July 2026 Committee on Economics and Social Sciences memorandum states that the primary economic studies currently being used to evaluate employment impacts are based on data that are now more than a decade old. The committee specifically cautions that the input-output models used in those studies do not account for price adjustments, business adaptation, substitution, or behavioral responses and may overstate long-term employment impacts. The committee recommends additional socioeconomic research into current employment, vessel and plant costs, production thresholds, harvester diversification, demand, and the economic contributions of the different menhaden sectors.

In other words, even the Commission's own economic experts acknowledge that we do not currently have adequate modern economic information to determine the full consequences of changing the Chesapeake Bay menhaden harvest cap.

The same uncertainty exists on the recreational side.

Maryland's 2021 fisheries data identified 329 Chesapeake Bay charter captains reporting charter activity. NOAA's economic data also estimated that Maryland's for-hire recreational fishery supported 584 jobs and generated approximately $62.3 million in sales and $38.3 million in value added in 2021. These figures do not represent the entire Chesapeake recreational economy, nor do they establish that menhaden availability is responsible for any particular portion of that economic activity. They do, however, demonstrate that the Bay supports a substantial professional and recreational fishing economy whose economic dependence on menhaden has not yet been adequately quantified.

That missing information is particularly important because the current question is not simply whether Atlantic menhaden are overfished coastwide. ASMFC currently reports that the stock is not overfished and that overfishing is not occurring. The unanswered question is whether sufficient menhaden are available in the Chesapeake Bay, at the appropriate locations and times, to support the Bay's predator populations and the recreational fisheries that depend upon them.

ASMFC's own Chesapeake Bay precautionary-management workgroup did not determine whether the Bay has an adequate supply of menhaden to meet predator demand. Virginia Institute of Marine Science researchers have likewise identified the need for research into Bay-specific menhaden abundance, distribution, predator demand, fishery impacts, and the economic value of menhaden to recreational fishing.

That uncertainty is precisely why I support the 50% reduction as an interim precautionary measure.

I am not asking the Commission to permanently eliminate the commercial reduction fishery. I am asking the Commission to temporarily reduce the Chesapeake Bay reduction-fishery cap from 51,000 metric tons to 25,500 metric tons while the necessary research is conducted.

The commercial sector can reasonably argue that reducing harvest could cause economic harm. I agree that this risk deserves serious consideration.

But the inverse risk deserves the same consideration: if localized depletion of menhaden is occurring, and if that depletion is reducing forage availability for economically important predator species, then maintaining the status quo while we conduct the research could impose economic costs on hundreds of charter operators and the much larger recreational-fishing economy that depends on healthy Chesapeake fisheries.

At present, we do not have sufficient science to confidently quantify either side of that equation.

That is not an argument for maintaining the status quo. It is an argument for obtaining better information.

Virginia has already appropriated $2 million over two years for Atlantic menhaden research, and Congress has provided $2.5 million to NOAA for Bay-specific menhaden research. I strongly encourage ASMFC, Virginia, Maryland, NOAA, VIMS, and their research partners to use these resources as a starting point for a comprehensive, independent bioeconomic study rather than allowing fragmented studies to answer only portions of the question.

That study should quantify:

• Bay-wide menhaden abundance, distribution, survival, movement, recruitment, and seasonal availability;

• localized depletion associated with reduction-fishery effort;

• predator consumption and predator distribution;

• the biological consequences of different Bay harvest levels;

• current commercial vessel, processing, labor, and community economics;

• the ability of the reduction fleet to shift harvest outside the Bay;

• current employment and economic contributions of the reduction and bait sectors;

• the number of active Chesapeake Bay charter operators;

• charter revenue, trips, catch rates, cancellations, employment, and associated spending;

• economic effects on marinas, fuel docks, tackle shops, boat dealers, mechanics, lodging, restaurants, and other businesses;

• and, ultimately, the net economic and ecological consequences of 0%, 25%, and 50% reductions in the Bay reduction-fishery cap.

Most importantly, the research should be completed under a clearly defined timeline, with the Bay cap revisited when the results are available.

The choice before the Commission should not be framed as commercial fishermen versus recreational fishermen. Both are legitimate industries that deserve to be considered.

The real question is whether we have enough information to determine how many menhaden can be removed from the Chesapeake Bay without undermining the ecological and economic functions that depend upon them.

Right now, by the Commission's own economic analysis and Virginia's own research recommendations, we do not.

Therefore, I support the 50% reduction as a temporary precautionary measure while the Commission invests in the comprehensive science necessary to establish the appropriate long-term harvest level.

If future research demonstrates that a higher Bay harvest can be sustained without compromising menhaden availability, predator populations, recreational fisheries, or the broader Chesapeake Bay ecosystem, management can be adjusted accordingly.

But until that information exists, temporarily reducing harvest while obtaining the missing science is a prudent way to manage uncertainty while recognizing the legitimate economic interests of all users of the Chesapeake Bay.

Please lower the amount of menhaden allowed as an annual harvest--the supply is clearly being overused, and severely disrupting the balance in nature. In particular, industrial fishing should not be allowed.

Subject: Public Comment: Atlantic Menhaden Draft Addendum II

To: comments@asmfc.org

Dear Mr. Boyle and Members of the Commission,

I am writing to urge the Atlantic States Marine Fisheries Commission to take immediate, strong action to protect the Chesapeake Bay ecosystem by implementing strict catch limits under Atlantic Menhaden Draft Addendum II. Specifically, I support options that substantially lower the reduction fishing allowance in the Bay.

As a resident/supporter of the Chesapeake Bay region, I am deeply alarmed by the unprecedented breeding failures and starvation currently devastating our local osprey populations. Decades of scientific monitoring show a direct link between the lack of mature Atlantic menhaden and the inability of ospreys to successfully raise their chicks.

Menhaden are the ecological backbone of the Chesapeake Bay. Allowing industrial-scale reduction fishing to deplete this

critical forage fish at the expense of ospreys, striped bass, and other native wildlife is unsustainable and unacceptable.

Please prioritize the long-term health of the Bay's ecosystem over short-term commercial harvest by implementing the maximum possible protections in Draft Addendum II. Thank you for your time and consideration of these comments.

Sincerely,
Donna Moran
Stevensville, MD

I'm a retired physician-scientist who has been interested in the impact of environmental chemicals on human health. There is far too little data on the impact of estrogenic pesticides on declining sperm counts in men worldwide, so I wonder if this could add to the decline in mehaden population and the osprey who eat them. In addition, rivers that feed into the Bay dump many different chemicals and microplastics, which are rarely tested for. For example, herbicides may slow the growth of marsh grasses that protect crabs, and clams and oysters that are filter-feeders may die from ingesting microplastics, or worse - passing them into diners higher up in the food chain, including people!
I worry that we have forgotten the work of Rachel Carson the writer of Silent Spring, and that herbicides and pesticides are the new DDTs and microplastics are the new asbestos. Please remember that the absence of evidence is not proof of absence, where the data you look at may be biased and not the root cause of the problem. Thanks.

We have monitored the Cayuga Lake Basin Ospreys for the past 15 years as part of the Cayuga Lake Osprey Network. We have the second largest colony of Osprey in New York, outside of Long Island, with 200 nesting pairs - and growing. The basin, surrounding lakes and watersheds have a large supply and variety of fish, throughout the season - trout running in March, lake and stream fish in the summer and fall. When it rains, Osprey fish further out in the lake or at ponds on private land. And so it goes throughout the season. Our food issues relate to the inexperience of new parents rather than our fisheries.

In the Chesapeake, however, Osprey nesting success appears to be substantially better in many freshwater and lower-salinity Chesapeake tributaries than in the saltier portions of the Bay. Researchers studying the decline have examined a range of possible causes and currently conclude that food limitation, particularly reduced availability of menhaden in areas where ospreys depend heavily on them, is the most strongly supported explanation. The geographic pattern of healthier populations in tributaries and poorer reproduction in saltier menhaden-dependent areas is consistent with a food-supply problem rather than a Bay-wide disease or toxin event, although ongoing research continues to evaluate all potential contributing factors.

Ospreys depend on menhaden, and recreational fishermen use them sparingly as bait. The Chesapeake Bay's largest direct removal of menhaden comes from the industrial reduction fishery - a harvest of that magnitude deserves careful scrutiny to

ensure that sufficient forage fish remain in the Bay to support the broader ecosystem.

The debate over menhaden in the Chesapeake Bay should not be framed as a choice between jobs and conservation, or between people and ospreys. The question is whether Virginia can maintain a sustainable menhaden fishery while ensuring that enough forage fish remain in the Bay to support the broader ecosystem.

Today, Virginia stands alone on the Atlantic Coast. It is the only East Coast state that still permits industrial-scale menhaden reduction fishing, and the Omega Protein facility in Reedville, Virginia is the last remaining menhaden reduction plant on the U.S. Atlantic seaboard. The industrial harvest is conducted by a single enterprise: Ocean Harvesters, which catches the fish, and Omega Protein, which processes them into fishmeal and fish oil.

This does not mean industrial fishing is solely responsible for every challenge facing Chesapeake Bay ospreys or menhaden populations. However, it does mean that the Bay's largest direct removal of menhaden comes from one industrial reduction fishery and therefore deserves careful scrutiny when scientists observe food stress among predators that depend on forage fish. Recent research has identified food limitation as the leading explanation for widespread osprey reproductive failure in higher-salinity portions of the Bay.

Virginia should not have to choose between ospreys and fishing. Instead, Virginia should examine the best management practices available elsewhere. That includes ecosystem-based forage fish management used by neighboring Maryland, coastwide scientific assessments conducted through the Atlantic States Marine Fisheries Commission (ASMFC), and lessons from the Gulf Coast menhaden industry in Louisiana, Mississippi, and Texas, where large-scale reduction fisheries continue to operate under modern management frameworks and sustainability certifications. At the same time, Virginia should recognize that coastwide stock assessments may not fully answer questions about localized depletion within the Chesapeake Bay itself.

The goal should be simple: maintain a healthy Chesapeake Bay ecosystem, support sustainable commercial fishing, and ensure that future generations inherit both a viable fishery and a thriving osprey population.

Please do the hard work and do the right thing in the Chesapeake so both fishermen and your amazing Ospreys have a chance to thrive again.

To whom it may concern (like all of us),
As a homeowner on the Chesapeake Bay, I have seen a steady decline in many of our fish species including striped bass, red drum, and large bluefish (and there are others). This is over the last eight years or so. The commercial harvesting of menhaden is the number one culprit. Using aircraft to spot schools of these fish is unfair and should be banned. Why is it illegal to harvest these fish in Maryland and not Virginia? Do they know something that we don't know in Virginia or are they just care more about this important fishery? The Omega company's lobbyists must have some serious influence in Richmond. This is wrong and the commercial fishing of these important baitfish should be banned. Would jobs be lost? Probably some but the jobs will be lost once the resource is not economically feasible to harvest due to limited populations. Do we have to wait for a disaster to happen before we take action? Please consider a full ban on this practice.

The osprey population has continuously declined, and just experienced its worst decline ever. https://ccbbirds.org/2026/09/14/2026-osprey-breeding-performance-was-the-worst-ever-recorded-for-the-chesapeake-bay/?_bhlid=ceb52f62aab58ffffb21b0bb003b166d0e064c9b

The reason behind this steep decline is food stress. See id. Ospreys depend on menhaden fish for survival . Lowering the cap on commercial menhaden harvests would be extremely detrimental, if not catastrophic to the environment and the osprey as a species. Osprey chicks are starving to death, as the parent birds do not have enough access to menhaden fish. To further allow menhaden fish to be overfished will certainly result in the extinction of the osprey, which will cause a cascade of failures in the ecosystem. This can easily be avoided by ensuring the osprey have access to menhaden and not allowing overfishing. It is an easy choice. Please make the right choice to protect our environment, menhaden and the osprey population.

Regardless of the cause (water quality, climate change, over harvesting, etc) there are no longer enough menhaden in the Chesapeake Bay to support both the ecosystem and a large scale industrial fishery. That is why I fully support the 50% reduction in the bay cap.
Also, industry claims about job losses are just fear mongering. If you check the records, there were three years in the past decade where the Bay harvest only averaged about 26,000 metric tons (50 % less than the current cap) and there were no layoffs. They simply fished more in the ocean.

I support lowering catch limits for Atlantic menhaden or otherwise increasing their presence in the Chesapeake. Decline in Osprey (because their young are starving) could have ripple effects on the health of the Bay- until we know more, protecting their ability to survive and thrive is important. And, who doesn't thrill to see an osprey nest and the birds with their young when hiking or kayaking in the watershed?

Please please do not continue to allow commercial or recreational overfishing of any species, but especially menhaden. Whatever the reason any building block species is low, we collectively have an obligation to stop allowing further depletion of any species. The commercial fishing of menhaden should be stopped immediately to allow stocks to replenish, so that the entire food chain can recover. Studies can be done while the commercial fishing is stopped.

I am now 68 and have enjoyed watching ospreys in Chesapeake Bay since I was a teenager when I moved to this area. It would be a terrible loss if they disappeared due to a lack of food. The over fishing of menhaden is creating this situation, so I hope legislation will make it possible for the ospreys to thrive again in the Chesapeake.

For over 25 years I've been boating on the Bay. You don't really notice the gradual decline of Osprey nests until soneone/ something brings it to your attention. On almost every marker, can, buoy leading out to the Bay proper , you would see these magnificent Osprey nests....some with chicks....heads up screaming to be fed. Their parents fly by or even close to you as a warning to not get too close. These birds stand majestically on those markers, etc. as if to say "this is my home , take care of it". The past few years there has been a definite decline in seeing these creatures. They are just not there...no nests...! So very very sad.
If more controlled menhaden fishing can change that, then let's get to it. Please just stop it!

We have monitored the Cayuga lake basin Ospreys for the past 15 years and are very knowledgeable about these amazing raptors and their conservation. Thankfully, our area has a large supply and variety of fish, throughout the season, for our Ospreys and the many other birds and mammals that rely on this food source. Osprey diet is solely fish, so when your area doesn't have enough fish you are literally starving them. Please limit fishing in the Chesapeake so your amazing Ospreys have a chance to thrive again.

As a lifetime resident of Maryland--40 years in beautiful Calvert County--I have always thought of myself and other area residents--as I'm sure local Native Americans of this area thought of themselves--as people of the Bay.

The sharply declining populations of menhaden threaten so much of what we love and value about the Chesapeake Bay. What would life here be like with our Osprey? Rockfish? Blue Crabs? What if we never again saw dolphins swimming in the Bay? All these treasures are dependent upon a healthy menhaden population.

I strongly support whatever Bay scientists recommend is necessary in terms of fishing controls to restore a healthy menhaden population. Corporate greed has run amuck everywhere it seems. We don't want any part of what remains of our precious environment destroyed for the sake of some company's bottom line. Protecting menhaden is protecting the lives of Marylanders. Please protect our menhaden.

Our family has been in the fishing industry for decades. It unfathomable that we'll allow a keystone species to be depleted as it has. It's quite obvious that there is a lot of money involved in which the policy makers are considering more than the ecological damage that this causes. Osprey's are what we see, but the sport fish and other species are being decimated due to their food source being so badly depleted.

Therefore, it is my recommendation that the catch limit be reduced by AT LEAST 50% for 5 years to determine if this change has a net positive effect on the birds and fish species that rely on Menhaden. While that is being done, additional studies should be completed to look at any other additional factors that may be causing the decline of the sports fish and ospreys.

This is a personalized plea to increase the cap to 90%.

I have been rescuing raptors here on the Chesapeake Bay and surrounding waters for nine years. Due to my centralized location, I rescue a lot of ospreys. From 2017 to 2024, I routinely rescued double digit numbers of this raptor alone, typically 11 - 18 each year. In 2025 and 2026, I rescued low single digits. I'm dispatched to rescue ospreys in these counties along the Bay and the surrounding waters: Anne Arundel, Prince Georges, Baltimore, Harford, Queen Anne's and Talbot counties.

Me, my fellow rescuers and the wildlife rehabbers - we are the boots on the ground, ground zero witnesses to what has happened to the osprey population on the Chesapeake Bay.

In 2024, the majority of ospreys rescues I did from April to October were thin, starving birds - adults and fledglings. I've had them die in my arms. They were literally skin and bone, unable to move much at all. It's infuriating, heartbreaking and demoralizing, seeing how bad these birds are.

It's really hard and horrible to pick up the starving fledglings. They haven't even had a chance to live, to migrate, to find a

mate, build a nest and raise young of their own. I can't tell you how often I've cried, racing to get one to the rehabber, only to find it dead in the box on arrival or die shortly after being admitted for treatment, not to mention euthanizing on arrival (EOA) because even though the bird is alive, it's beyond saving and the kindest thing we can do is end the suffering.

It's also horrible when finders call me, frantically asking how to save nestlings that have been abandoned by parents. What we saw last year and this year was early nest abandonment - sometimes the parents gave up and left before laying/hatching eggs, leaving and migrating early while leaving nestlings and fledglings behind. It's beyond heartbreaking to see a fledgling or almost fledgling stuck on an inaccessible nest, calling for the parents, who are long gone. It's almost impossible to get them off the channel markers and other platforms that are too high to put up a ladder. We have to wait until they jump or almost fly into the water and hope we can get them before they drown.

I have no pity for the overseas market for menhaden. Let them learn how to make a synthesized version of the menhaden for their use. I know that what I propose will put the commercial fishing company out of business and Reedsville VA citizens will lose their jobs. Fund training for them to learn new careers. This harvesting is not sustainable. When all of the menhaden are gone because these commercial outfits have stripped the bay bare, what are they going to do then?

As of this year, I'm coining the phrase "geographically extinct" for the ospreys. It's not completely accurate, but I feel like it's close to the truth. Out of the five neighborhood nests I watch here on Rock Creek off the Patapsco River, two sets of parents arrived this year. One set left in early May; as best as I can tell the other set may have successfully raised one fledgling.

Typically, I hear and see ospreys migrating or fishing here on my creek. I also typically see large schools of young menhaden grow up here, right off my dock.

This year, my creek was completely empty of menhaden. Not one school was here this year. The last time I heard or saw an osprey on my part of Rock creek was the last week in July.

It's time to stop dithering with proposals and putting caps in place in 2027. The entire marine food chain is impacted, and it's only a matter of time before other wildlife that eats Chesapeake bay critters will be impacted, such as otters and heron.

Implement the cap now.

STOP REDUCTION FISHING! How stupid can you be not to SEE what is in front of you? I hold a commercial license. I live in an area dominated by commercial fishing. I am on the water a LOT (MOBJACK).

I can see no bait. I can see the Osprey's suffering.

WHY CAN'T YOU?

You are letting a foreign corporation RAPE our waters! It obviously is a very lucrative fishery based on how much they PAY OFF our representatives.

I have been fighting this for 25 years, I used to discuss this with Rep Harvey Morgan A LOT. What would it hurt to to a three year moratorium to see if things get better?

In Maine, the herring came back to the Meherrin River when this was halted AND the Bluefin came back to near shore Gulf of Maine so the small boats could once again enter a harpoon fishery.

Where are the Boston Mackerel, remember in the 90's you could head boat off of VA beach for them?

Where are the Shad and Herring? Are they a bycatch of this INDUSTRIAL REDUCTION DESTRUCTIVE FISHERY? North of 350 Million Tons? Gone EVERY YEAR WTF?

As for Reedville, Factory Point would be worth a LOT more in TAXES if it was redeveloped.

Kind of Respectfully (but I have been shouting this for 25 years and no one is listening),
Dave Onesty

To a non scientist is seems obvious that the menhaden reduction industry in Virginia has seriously depleted the menhaden stock and every species that feeds on them. I feel that a total shut down of this industry is necessary for a few years. In my opinion the industrial boats can not be trusted otherwise.

I'm in favor of adoption of the Draft Addendum II and, more generally speaking, tight control of the Menhaden fishery as needed to support the many predator species that rely on Menhaden. I'm particularly concerned with reports of Osprey chick mortality and failed nests. Osprey were once ravaged by DDT. I don't remember seeing any during my many trips to to NJ beaches in the 70s and 80s and was enthralled to start seeing them over the past couple of decades. To revert back to a condition of scarcity and endangerment would be disheartening.

Thank you for your consideration.

Please reduce the menhaden caught in the Chesapeake by a least 50%. The overfishing of menhaden has drastically reduced the overall health of species of the Chesapeake who rely on menhaden to exist, especially disseminating the Osprey population with a 90% decline in their nesting activity in 2026 alone. Theses allowable catch limit changes need to be made immediately, as it may be too late before the Osprey becomes extinct. Is that how Virginia wants to be remembered? As the major contributor to the extinction of the Osprey.

The importance of the Menhaden population cannot be understated. The Osprey especially, are among many other species whose existence depends on the Menhaden. We must do more to ensure the Menhaden not only survive but thrive more than enough to sustain the future lives of the new Osprey chicks. Please enact controls on the commercial fishing. There are other places to fish besides the Bay and its tributaries. The companies don't have to go out of business, just go somewhere else.

"I support a 50% reduction in the bay cap and the use of quota periods." We had a huge fish kill on June 30th at our place at the mouth of the York River. There were literally hundreds of thousands of small croaker scattered floating and in rafts that stretched for well over a mile along our beaches. We have neighbors that will testify that an Omega menhaden trawler was out in front of our houses either anchored or broken down on Monday. We called Virginia Marine resources, and they responded within the hour. The officer stated this was a release of fish by a trawler (this statement did not get quoted in the report) as there was no evidence of a gill net.
This is an excellent proof of the" biproduct" kill of our game fish! We used to catch croaker that were 18-20 inches long. If we catch on now, it may be 9 inches long. The fishing off my beach, in year's past, was truly spectacular for red fish, trout and rock fish--now it is next to nothing. These Omega trollers with their long nets sweep the shallow waters of the bay. I've had logger head sea turtles wash up on my beach dead. When we purchase menhaden to bait our crab pots, what used to be 1-to-2-pound fish are now 6 to 10 ounces. Everybody talks about the pounds of fish taken what they don't tell you is taking 2 to 3 fish to make a pound. In year's past I've seen as many as 13 osprey diving on bait in the shallows in front of my house on Jenkins Neck Rd in Hayes--we'd have at least 2 nests on our 5-acre lot...now we have no nests and see one to two ospreys at best feeding. I am unable to attach the FOIA report, however, please research case # is MP26-00171 as filed by Officer Kelly Evans w/ the Virginia Marine Police.
In 1984 I worked in a Newport News field office of Congressman Herb Batemen--the year we shut down the rockfish season--we once had to vacate the office due to death threats for taking this firm stance...and our rock fishing came back so strong--now with no menhaden in the bay this hatchery is all but gone again. Please stop the madness! Thank you, Mark Douglas (804) 615-6601.

I support a 50% reduction in Menhaden catch from the Chesapeake By, and the implementation of quota periods for Menhaden fishing. I have boated the Bay for decades and have sadly watched its decline. Not all of the decline is due to the Menhaden reduction, but the bunker filter the water and are a free resource. They are critical to the Bay's health, and are just no longer there in anything near the numbers necessary.

I live on Dividing Creek on the Northern Neck and have been boating and fishing on the Chesapeake for 30 years. In that time, the schools of menhaden have been steadily declining. This has impacted the osprey population, larger fish, and the overall ecosystem of the bay in countless ways. It is far beyond time to meaningfully regulate and reduce the menhaden catch on the bay. The environmental cost of allowing purse seine netting has become too great.

I fully support a 50% reduction in the Chesapeake harvest. I would support a much greater reduction. However, I believe this must be accompanied by a coastal redcution in all states to prevent harvest from being shifted from the Chesapeake to other areas. The menhaden in New Jersey have vanished and it is impacting the entire coastal ecosystem from crabs to finfish to birds.

Reduce the quota. I've seen a huge decrease in adult and juvenile menhaden off the coast and inland waterways of Long Island. This decrease has resulted in a decrease of wildlife that we have seen in the past years including whales Porpoises, shark and striped bass.

The osprey are dying and they are not able to feed their young. Reduce the commercial fishing. Increased bait fishing is wiping out the food sources of whales and dolphins and osprey. Do the right thing and save the wildlife that relies on these fish. Look at the stats listen to the environmental experts. This is a home we share with this wildlife and it is heart wrenching to see osprey pairs failing and starving and whales washing up on our beaches.

Please reduce the amount of menhaden Omega Protein can take in the Chesapeake Bay! The health of the bay depends on you ! Menhaden are feeder fish that many species depend on. Game fish and birds depend on menhaden for food. Please,Please,Please reduce the amount of feeder fish taken from the Chesapeake Bay! If something is not done, I fear that someday my children and grandchildren will not be able to enjoy the bounty of the Chesapeake Bay if it's destroyed by over commercial fishing!

Please consider shutting down any and all Menhaden harvesting on both Atlantic and Gulf seaboards , Please take into consideration that many species depend on a healthy population of Menhaden, Whales, Bluefish, Striped Bass, Dolphins, Ospreys, Eagles to name a few! Please put a total ban Until research by viable source can provide valuable information regarding population.. Once they are depleted nothing there is no coming back .. Think about it please John Tefankjian

I support a 50% reduction in the Bay cap and quota periods. The fact that we are allowing an ecosystem as important as the Chesapeake to wither so a company can make dog food out of the fish is insane to me. Dogs eat anything remotely close to edible. Make their food out of something else.

The VA legislature has been abysmal on managing this issue. If understand the above overview correctly, 2006 - 2010 a cap of 109,020 mt was in place, reflecting the average landings from 2001 - 2005. It was lowered to 87,216 mt in 2012 and Amendment 3 reduced the Chesapeake Bay cap to 51,000 mt... to reflect the average reduction landings in the Bay from 2012-2016. So, in 16 years the average landings went from 109,020 mt to 51,000 mt while the quotas allowed more fish to be taken. Landings went down 53%. It would certainly appear the fishery is in serious decline. Overfishing, pollution, climate change, predators, etc. etc. all may play a part in this. Until we know what the cause truly is, we must take action on what we can manage that will have an immediate impact. That is REDUCTION FLEET. Eliminate it! The other causes need to be addressed as well, but they are very long-term corrections. We cannot allow overfishing to continue while we wait for the long-term corrections. I support an elimination of the reduction fishery in the Chesapeake Bay. Require the fishery to conduct all harvest operations outside of the bay. A 50% reduction in the bay cap is a joke. 50% of what!?!?? Push the reduction fleet offshore. Bob Lewis

The Chesapeake Bay is an invaluable natural resource that is not being fished sustainably or humanely. There need to be limits on fishing that place the overall health of the Bay above making money via commercial fishing. There also needs to be a way for commercial fishing to not destroy everything that lands in their nets. Virginia is not being a good neighbor to other states by not limiting commercial Over Fishing of menhaden which is destroying the Bay's delicate infrastructure that includes all living creatures who depend on the Bay, including people.

I support the 50% reduction. I have watched our osprey population starve in recent years. Nests that have been around for 5+ years are non existent. Pairs that have produced offspring are no longer reproducing. Bunker are non existent due to the OMEGA boats. Our fisheries are slowly dwindling away. We are beginning to see population of fish make their way out of our area due to lack of food. I have seen 1 whale in 15 trips out of east rockaway inlet. Find the bunker find the whales. Find the bait, find the fish. OMEGA boats are the opposite of conservation.

Why is it every other state on the eastern seaboard has already moved to protect their state waters except Virginia? If the Chesapeake bay is to ever become what it once was it's time to prioritize its fragile ecosystem starting with menhaden and protecting the foundation to the food chain for once chose your constituents over foreign companies lobbyists and their money…..our bay is more important than their bribes

Sirs, I am a sports fisherman and I've fished the bay since 1970. I have observed fewer and fewer menhaden schools in the lower bay. This past Monday, I fished from just below Cape Charles to the Chesapeake Bay Bridge Tunnel without seeing the first school of menhaden. I cannot ever remember this happening in the past. The prior week, the Omega ships and their spotter plane worked the area. To my knowledge, we are the only state on the east coast to allow the taking of menhaden inside state waters, or even within one mile of the beach. We know this is a valuable fish to the health of the bay. Menhaden and oysters are filters for our water, improving water quality for other species, not to mention for fish and birds which are dependent on menhaden as their primary food source. I would like to see the bay closed to this reduction fishery, but for the immediate future, I strongly support a 50% tonnage reduction. This could be a great help to our bay. Sincerely, Randy Morton

It is ridiculous that a forage fish as important as menhaden is for the ecosystem is allowed to be harvested at such large quantities. The reduction of this fishery does not need to only occur in the Bay but also coastwide. A reduction in quota would help bolster the population. As an avid fisherman I have watched the population continue to dwindle each year with menhaden. There used to be schools that were miles long, now there is just small pods. The best result I have seen is when the quota was reduced a few years ago and the population bounced back. I hope this council actually looks at reducing the actual quota rather than just moving the quota around and changing harvest times.

I support a 50% reduction in the menhaden harvest in the bay along with harvesting quotes broken into segmented time durations throughout the year. I believe the ultimate goal is to ban all harvesting of menhaden with-in the Chesapeake bay and out 3 nautical miles from the Va coast.

Omega should be barred from all catching in the Bay! I am 82 years old and have been fishing and enjoying the Chesapeake Bay since 1966. Things have really changed a lot over the last 60 years and not for the better. Thinks got much worse when they moved their Gulf of America fleet to Virginia following hurricane Katrina. When they make a sweep (4or 5 ships), for the next several days, you will catch a very small percentage of what you caught before the sweep. They keep any and everything that gets swept up in their nets. Why does Virginia allow them to get away with this. While Maryland doesn't get much right, it had enough sense to prohibit them in Maryland waters. The Osprey population appeared to be much lower this year probably due to lack of enough food for their young. I can't understand why anyone other than Omega and paid politicians could possible think this raping of our precious natural resource is a good idea. I say send the bastards back to Canada.

SAVE THE CHESAPEAKE BAY! Stop the menhaden netting and let Mother Nature's filter feeders help to clean up the water by straining plankton and converting the sun's energy into fat and protein that feeds the predator fish up and down the bay. Let those industrial netting boats scoop menhaden out in the ocean about 100 miles offshore of Virginia's beaches. Those industrial purse seine fleets operated by Canadian-owned Cooke Seafood are scooping up tons of Porgies and are killing the predator fish as bycatch. The recreational fishing community is falling apart due to lack of the menhaden in the bay. Tackle shops are closing and some large companies are closing their doors due to the lost of game fish in our waters. Department Of Natural Resources has placed a limit of fish that can be kept that are not supporting the cost of fishing and fishermen are not going to pay hundreds of dollars to a guide or captain to catch just one or a few fish.

Chesapeake Bay is the nursery for the fish and mammals and birds of the Atlantic Ocean. Menhaden is their nutrition. We allowed this nutrition to be made into dog food while the nursery inhabitants are starving. Dog food can easily be made without Menhaden. I support a at least 50% reduction in the catch. I also think it's time that observers are on the fleets that catch Menhaden and I support a scientific study of the Menhaden and the impact the industrial fishing has on the Bay (on its people and the animals). Once the Menhaden population collapses it's too late. Andrea Steegmayer

My preferences for the proposed management plans are as follows:
3.1 - Chesapeake Bay Reduction Fishery Cap Amount: Sub Option B4 - 50% reduction, not linked to TAC
3.2 Chesapeake Bay Cap Distribution
3.2.1 Quota Periods: Option B2 - even length and uneven harvest
3.2.2 Quota Period Overages and Underages - Option B - quota period overage payback with rollover of unused quota
3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision - option B - 3 year revisit provision

My reasons are as follows:
Menhaden is a public trust resource, owned by all the citizens of the Atlantic states subject to ASFMC's jurisdiction. These citizens entrust ASFMC to manage the menhaden population for a variety of reasons that provide benefit to the citizens; among these benefits are economic and ecological. The draft management plans cites the economic benefits of the reduction and bait fisheries to the coastal economies of VIrginia and Maryland. The draft management plans also cites ecosystem benefits as a forage species, but unfortunately, it leaves out the economic value of forage fish. There is real value that flows into coastal economies from fish that are not harvested in bait or reduction fisheries, and that value is not accounted for in this

plan. That value exists because of menhaden's role as a forage species for countless other species that constitute popular commercial and sport fisheries of substantial value. A fish not caught in the reduction fishery still has economic value to the region, because it is available to be eaten by a predator, who then is the target of commercial and sport fisheries which have immense value. None of that value is mentioned in this plan when considering the impact of changes to the Bay Cap on the economic health of the region.

The ASFMC is not accounting for the full value these fish provide to the constituents, and as such, should move forward with great precaution that the currently allowed harvest levels may be too much and are preventing menhaden from providing maximum economic yield (MEY) to the Atlantic States. The even ASFMC admits it doesn't have a good understanding of how to set the Bay cap to account for forage needs in the Chesapeake Bay. (Page 6, paragraph 4 - "No similar approach exists to set the Bay Cap at a level scientifically determined to support forage needs in the Chesapeake Bay…."). If the ASFMC is at all unclear about the ecosystem interactions about menhaden and other valuable forage species within the Bay, they must proceed with utmost precaution to avoid reductions in value of those predator species that rely on menhaden.

For those reasons, I demand the ASFMC adopt the most drastic reductions in the Bay Cap, and defer more of the catch until later in the season, and revisit this plan frequently to aggressively monitor its progress in providing MEY of the menhaden fishery to all constituents of the ASFMC.

The loss of manhaden is preventable. Simple as that. Business must share in this issue more than has been assigned. I have personally witnessed the terrible impact it has has on our osprey population and the striped bass fishing is essentially done, which is a critical part of New Jersey's economy (and my personal enjoyment)

Born and raised on the water. 38 years ago. My grandfather a ww2 vet in his past time in Bayville nj help and maintain offspray nest on bayveiw Ave in Berkeley township. Every thing that was built and saved is being taken from us for money. Not to include the lack of bait to hold fish in are local water. I am and always have been a water men. I can't say I'm the best fisherman around but surly put my time in. No bait no fish it's pretty simple. Fish catches are down are birds are dying everywhere a clear ideation of are environments health. How ever I am not a well educated man. And I am pretty poor with words and spelling. No matter we do or say or what proof we show.... it will never make a difference. We are selling what's is left of a lively hood for profit. At some it has to end or there will be nothing left. Numbers are numbers. And there all showing the same data. It has to stop. Not to mention I have photos of two different bunks boats in 50 ft of water from last yr with in a half mile of the beach. Witch is wrong. When are we going to let the ocean recover... herebi am 9.38 at night on a friday... hoping something will happen. Knowing it is just false hope. Please save are ocean...

I can only say what I have experienced and that is a severe reduction in bunker school in size numbers concentration and consistency over the years. With that we also see the same decline in some of our inshore recreational species. Our fisheries all start from forage fish and we rely on them for clean water. I feel I'm just stating the obvious and that everyone who's involved in this knows that we as locals deserve the fish and clean water not private equity trying to make a buck on dog food or Chinese companies feeding farm raised fisheries in places void of fish due to their lack of regulation and self restraint. Please do the right thing and reduce the quotas

I have loved on the NJ coastline and fished for the last 35 years recreationally. I am disgusted by the reduction menhaden fishing in our NJ waters by foreign companies shipping the local caught product to support international markets. These Canadian companies has descimated their own forage fish stocks of mackerel, herring and others, and now working to decimate our local forage fish menhaden.

The last two years have shown a drastic decline in local bunker schools off the coast of NJ followed by poor showing of humpback whales, porpoise, declining osprey nest health, stripers and the other predators that rely on this forage species.

I have local fill net bunker fisherman friends that cannot harvest there 500# quota for local bait markets due to the depleted stocks.

The recreational fishing industry supports thousand of families in the area and the lack of bunker hd affected them all. The fact that the US government supports a couple large companies with a small amount of employees to catch metric tons of our filter feeding forage fish is ridiculous. We need drastic cuts to the purse seine fleet quotas on menhaden to protect this once plentiful forage fish and the ecosystem it sustains.

Please stop the political nonsense and act today!

To the ASMFC,

I am writing with grave concern about the state of the menhaden population. I am a physician by training and did research throughout my training, and in doing this, you learn to read patterns. And the patterns in the data here are extremely worrisome.

The science here is well done and raises alarm. The coastal Osprey's that depend on menhaden can't feed their young. This is a harbinger of potential ecosystem collapse as Osprey's are an indicator species.
https://pubs.usgs.gov/publication/70276607

When do you act? I worry you will wait until there is catastrophic collapse. Will menhaden become the Atlantic cod? If so, the bay fishery is as good as dead.

The menhaden population must be protected to ensure the health of the ecosystem that depends on them. I strongly encourage you to adopt the Atlantic Menhaden Draft Addendum II with a reduction in the Atlantic Menhaden Chesapeake Bay

Reduction Fishery Cap of at least 50%. I worry this does not go far enough fast enough to save the ecosystem. If reductive fishing is sustained at the current rates, who benefits? Not many many people and wildlife who depend on the bay ecosystem, but the bottom line of foreign companies who do not have to care what happens if the fishery fails.

Follow the best available science (and please talk to actual scientists and conservationists. Industry scientists have a vested intersted in their own bottom line. I've seen this with industry funded pharma trials again and again in medicine). Reduce the coastwide total catch to ensure sufficient menhaden for the ecosystem that depends on them.

If my children and future generations have a vibrant, thriving bay depends on you to make the decisions based on sound science, not on the desires of rich companies and moneyed interests.

Sincerely,
Eric Nolley

It is long past time to reset the limits on menhaden catch in the Chesapeake bay and beyond. For years we've been told - we need more research. Well here it is in black and white. This resource that belongs to us all is being strip mined of one of its most critical resources, the fish on which much of the life in the bay depends. Reduce catch limits by at least 50% now.

I am writing to express my strong support for reducing the Chesapeake Bay reduction fishery cap by 50% and creating sensible seasonal quota periods to distribute menhaden harvest under the cap more evenly throughout the fishing season.

Every morning our resident osprey suns himself from the top of a large tree, overlooking the waterway. In the spring, his mate arrives and they build a giant nest and raise their chicks overlooking the water into the summer. This waterway is also enjoyed by human anglers and the birds and human fishermen are able to feed their families.

This summer, the chicks tragically did not make it. There was not enough menhaden to help them to thrive and grow strong enough to leave the nest. The ospreys have to fly longer distances, and the parent ospreys looked stressed and ragged, thin and were gone for longer periods of time desperately trying to find food to keep their babies alive, to the point I worried about them, and at several points feared they were missing or had perished.

I have never in the years I have lived here, seen anything as bad as this last nesting season. I am just a regular person, and I noticed that something was extremely wrong this season-so much so, that I reached out to everyone I could, to ask what happened.

It is that apparent and without productive seasons of chicks leaving the nests, the osprey can become lost to us forever. We need to protect our osprey and our bass and every other marine animal that relies on menhaden.

Apparently, this year many nesting pairs along our river were adversely impacted by starvation, and most failed to raise any chicks that left the nests. They starved.

This should not be happening.

We also noticed that anglers used to be able to catch very sizable fish in the area, the same area that the adult ospreys fish from, and the catch is becoming smaller and smaller, and this is because those fish are also not getting the nutrition from the menhaden. It is effecting the entire food chain all the way up to human anglers trying to feed their families, as well.

We must implement a stricter cap for these critical reasons:

• Protecting Wildlife: Menhaden are the foundation of our marine ecosystem. Leaving more of them in the water is vital to reversing the devastating food shortages currently facing nesting ospreys, struggling striped bass populations, and other marine predators that rely on this critical forage fish.

• Supporting Local Fishermen: A lower industrial cap protects local recreational anglers, charter boat captains, and light-commercial fishermen. Securing the local bait supply and game fish numbers sustains our community's small, family-owned fishing businesses rather than prioritizing a single industrial reduction fleet.

Please support the lowering of the cap and protect the long-term health of the Chesapeake Bay and the survival of our ospreys.

Sincerely,
Leslie Serbousek
Portsmouth, Virginia

I am writing to express my strong support for reducing the Chesapeake Bay reduction fishery cap by 50% and creating sensible seasonal quota periods to distribute menhaden harvest under the cap more evenly throughout the fishing season.

Every morning our resident osprey suns himself from the top of a large tree, overlooking the waterway. In the spring, his mate arrives and they build a giant nest and raise their chicks overlooking the water into the summer. This waterway is also enjoyed by human anglers and the birds and human fishermen are able to feed their families.

This summer, the chicks tragically did not make it. There was not enough menhaden to help them to thrive and grow strong enough to leave the nest. The ospreys have to fly longer distances, and the parent ospreys looked stressed and ragged, thin and were gone for longer periods of time desperately trying to find food to keep their babies alive, to the point I worried about them, and at several points feared they were missing or had perished.

I have never in the years I have lived here, seen anything as bad as this last nesting season. I am just a regular person, and I noticed that something was extremely wrong this season-so much so, that I reached out to everyone I could, to ask what happened.

It is that apparent and without productive seasons of chicks leaving the nests, the osprey can become lost to us forever. We need to protect our osprey and our bass and every other marine animal that relies on menhaden.

Apparently, this year many nesting pairs along our river were adversely impacted by starvation, and most failed to raise any chicks that left the nests. They starved.

This should not be happening.

We also noticed that anglers used to be able to catch very sizable fish in the area, the same area that the adult ospreys fish from, and the catch is becoming smaller and smaller, and this is because those fish are also not getting the nutrition from the menhaden. It is effecting the entire food chain all the way up to human anglers trying to feed their families, as well.

We must implement a stricter cap for these critical reasons:

• Protecting Wildlife: Menhaden are the foundation of our marine ecosystem. I support the CCA/MD position as follows:
CCA's Recommended Survey Responses
• Question 5 — Option C
• Question 6 — Option C1E
• Question 7 — Option C2A
• Question 8 — Option B2
• Question 9 — Option B
• Question 10 — No change
• Question 11 — Option B
• Question 12 — Abundant menhaden are essential to healthy fisheries and a productive Chesapeake Bay.

These recommendations support:

A 50% initial reduction in the Chesapeake Bay Cap

- [x] A Bay Cap linked to the coastwide quota
- [x] Less concentrated harvest during critical spring and summer periods
- [x] Accountability for seasonal quota overages
- [x] A required review of the Bay Cap every three years

James Boyle, FMP Coordinator:

Based on my personal experience recreationally fishing the Eastern Shore of Virginia over the last 15+ years, I've seen fishing become more challenging and Virginia's saltwater recreational fishing regulations become increasingly restrictive, despite a stagnant or declining number of saltwater fisherman over this period.

Similarly, watermen are struggling because the Chesapeake Bay blue crab population is 50% lower than it was in 2010 and access to menhaden as bait has become both more expensive and scarce, relying on out-of-state menhaden due to the recent collapse of the Chesapeake Bay menhaden pound net fishery, with estimates of a 97% reduction in harvest in 2025 compared to 2012. Likewise, a 2025 study by Dr. Bryan Watts of The College of William and Mary's Center for Conservation Biology documented a 90% decline of nesting osprey on Virginia's Delmarva Peninsula.

Like most fisherman, I fully support science-based restrictions to our fisheries to ensure this resource is available for future generations.

The option of a 50% reduction in the menhaden fishery cap should substantially improve the recreational fishery that rely on menhaden and improve the livelihood of watermen, bait watermen, and charter fisherman alike. With more plentiful menhaden, I would expect to see a dramatic recovery in osprey and other shorebirds that primarily subsist on menhaden. Lastly, the proposed 50% menhaden fishery cap reduction would further support the Chesapeake Bay's numerous other species and overall ecosystem health in ways we may not currently have the tools and resources to measure.

Based upon my personal experience and understanding of the science, I support the following options in Draft Addendum II:

3.1 Chesapeake Bay Reduction Fishery Cap Amount: Support option C1e that would reduce the Bay Cap by 50 percent and limits it to 13.6 percent of the Coastwide Catch Limit (TAC).

3.2 Chesapeake Bay Cap Distribution: Support option B2 which establishes three even length quota periods for the Bay Cap, but distributes harvest 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. Also, support option B which establishes quota period overage payback and rollover of unused quota within a fishing year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: Support option B Revisit Provision to reassess the efficacy of these new management tools every 3 years.

Thank you for the opportunity to comment on the Chesapeake Bay Reduction Fishery Cap.

I grew up fishing the Chesapeake Bay ever since I was a kid and I'm a 24-year-old man who owns his own boat and enjoys fishing year-round, I used to be able to catch fish after fish, including the big cow stripers in the winter time left and right but the bunker net Fishing has gotten so out of control. It is seriously impacting the population of striped bass here in the bay. Please at least cut the bunker netting by 50% to allow more stability and food for the striped bass!

Please take immediate action to limit or halt menhaden from being harvested. The osprey faced extinction once from a single chemical – DDT. Now they're facing extinction because of a single company over- fishing for bunker. Barnegat Bay 51% of the Osprey nests failed for 2 consecutive years. At this rate Ospreys as a species cannot survive. This is a man-made problem and demands a man-made solution. Real world surveys have proven the decline of the osprey due to the actions of human beings. Please limit the harvest in bays and the ocean. Thank you.

Please do what is right and reduce the harvest of the menhaden population in the Atlantic Ocean, a common ground can be found that is more sustainable long term. The amount of income that is generated through sport fishing and commercial fishing for species that rely on the menhaden for survival outweighs the profits made from menhaden harvesting alone. I know you guys will make the right decision, thank you.

As a New Jersey recreational fisherman, I support stronger protection of menhaden as forage for striped bass and other predators.

For Draft Addendum II, I support:

• Section 3.1, Option B4: reduce the Chesapeake Bay reduction-fishery cap by 50% to 25,500 metric tons, implemented immediately without a multiyear phase-in.
• Section 3.2.1, Option B2: distribute the cap 25%/25%/50% to preserve more forage during spring and summer.
• Section 3.2.2, Option B, without Underage Sub-option 1: require seasonal overage payback and roll unused early-season quota entirely into the final period.
• Section 3.3, Option B: revisit the Bay cap every three years.

Uncertainty about localized depletion should support precautionary management. Menhaden's value as food for striped bass and other wildlife deserves substantial weight alongside its commercial value.

Please also monitor whether reduced Bay harvest shifts fishing pressure outside the Bay and undermines the intended

ecological benefits.

Thank you for considering my comments.

Comment

Dear Atlantic Menhaden Management Board,

My name is Tom Wenskus, and I am a recreational fisherman from Long Island, New York. I support a precautionary approach to managing Atlantic menhaden and request the following selections in Draft Addendum II to Amendment 3:

Section 3.1, Option B4: Reduce the Chesapeake Bay reduction fishery cap by 50%, to 25,500 metric tons, without a multiyear phase-in.

Section 3.2.1, Option B2: Divide the annual cap into seasonal allocations of 25%, 25%, and 50%, reserving half for the final period.

Section 3.2.2, Option B: Require quota-period overage paybacks and retain the default provision that unused quota from the first two periods rolls into the third period. I do not support Underage Sub-option 1.

Section 3.3, Option B: Revisit the Bay cap every three years.

My primary concern is whether current scientific information adequately describes menhaden availability at the local and seasonal scales necessary to protect Chesapeake Bay's ecosystem. The draft acknowledges insufficient data to comprehensively characterize menhaden abundance and distribution throughout the Bay and the influence of fishing pressure.

A coastwide assessment does not, by itself, establish that sufficient forage is available in a particular area when predators need it. Menhaden management should account for their role in supporting striped bass, bluefish, other predators, and the commercial and recreational fisheries that depend on those species.

I recognize that the available evidence does not establish that a 50% reduction is the exact amount required. However, uncertainty about local forage availability is a reason to maintain a larger safety margin. Among the proposed options, I believe this combination provides the most appropriate precautionary protection while better information is developed.

I prefer a fixed reduced Bay cap over automatically linking it to coastwide total allowable catch, because an increase in coastwide TAC would not necessarily demonstrate improved forage availability within Chesapeake Bay.

I also urge the Commission to prioritize fishery-independent monitoring of menhaden abundance, distribution, and seasonal availability within the Bay, alongside research on predator forage needs. Future decisions should clearly explain how that evidence supports the selected harvest limits.

Thank you for considering my comments.

Tom Wenskus
Long Island, New York

Comment

I support taking a precautionary approach to management of the Chesapeake Bay reduction fishery under Draft Addendum II.

I support Option C, which would link the Chesapeake Bay Reduction Fishery Cap to the coastwide Total Allowable Catch (TAC). I believe the Bay Cap should be reduced from its current level by approximately 20–30% when this system is implemented, with the resulting proportion of the TAC maintained as the Bay Cap going forward. Linking the Bay Cap to the TAC provides a more consistent management framework and prevents future changes in the coastwide TAC from unintentionally changing the relative level of Chesapeake Bay harvest.

I also support establishing quota periods to reduce the concentration of reduction harvest during the middle of the fishing season. In particular, I favor a management approach that provides greater protection for menhaden availability during the spring and summer and shifts a greater portion of allowable harvest toward the later portion of the season. I support meaningful overage payback requirements so that exceeding an individual quota period has consequences in subsequent years, rather than allowing the seasonal limits to function only as guidelines.

Finally, I support a mandatory three-year review of the Chesapeake Bay Reduction Fishery Cap. Given the scientific

uncertainty surrounding menhaden abundance, distribution, predator demand, and the relationship between reduction fishing and local menhaden availability, management should be revisited as new scientific information becomes available.

I recognize that the available evidence does not establish that the reduction fishery is solely responsible for recent declines in menhaden availability or pound-net catches in Chesapeake Bay. However, the documented declines in some fishery-dependent and fishery-independent indices, combined with the concentration of reduction harvest during portions of the season, provide sufficient reason for precautionary management. Menhaden are an important forage species, and where there is meaningful uncertainty regarding their availability to predators and other fisheries, I believe management should err on the side of maintaining a robust forage base.

Overall, I support a moderate-to-strong reduction in the Bay Cap, a permanent linkage between the Bay Cap and the coastwide TAC, distribution of harvest throughout the season, enforceable quota-period overage payback, and a mandatory three-year review.
Thank you

I have had a front row seat to the struggles of osprey in my part of the Bay around Cape Charles, VA. As a wildlife photographer I've had to watch starving chicks fight with each other and watch parents abandon the nest, sometimes before the eggs even hatch, because they are starving. While there is likely more than one reason for this, it's certain that the continued decline in the number of menhaden in the Bay is a contributing factor. In addition to the birds, I've listened to local fishermen and guides lament the declining conditions and watch while some of them go out of business because the fish just aren't here any more. Again, while there may be more than one reason, it's for sure the industrial harvest of menhaden is a contributing factor. I respectfully ask that the commission adopt the following options in Addendum II.

Section 3.1 - Option C1e - Reduce Bay Cap by 50% and limit it to 13.6% of the total coast wide catch.
Section 3.2 - Option B2 - Implement the Chesapeake Bay Cap Distribution which would distribute the harvest over the season and minimize the impact on available fish during the critical nesting season.
Section 3.3 - Option B - Allow for the reassessment of management every 3 years so as the science progresses so can the management practices.

I have been fishing the Chesapeake Bay for 50 years. Currently fishing the lower bay regularly. The last three years have been the worst I have seen for Speckled Trout and Rockfish. This includes the years leading up to the Striped Bass moratorium. The pressures on the bay are many - warming waters, algae blooms, over harvesting, pollution. Please pass this legislation so that my kids can inherit a healthy bay!

Please reduce the fishery cap by 50%. Growing up in Connecticut in the 1980s and 1990s, we rarely saw Osprey due to DDT use before I was born. It brings great joy to see these beautiful creatures back home in their summer nesting grounds. Let's not repeat historical mistakes and protect their food source. When birds of prey thrive, we all thrive.

Hello my name is Nicholas Good and I would like to add my two cents to this issue. It's obvious there is a continuing problem that I see every weekend. . I fish the bay from the bridge to the state line down near the target ship on the weekends very frequently for many species . How long do we wait until it gets so bad it's too late? I see barely any schools of bunker and if I do there are very small peanut bunker and if there is a school it's hardly existent . I remember in 2007-2010 I would snag very large ones trolling and see massive pods . That hasn't happened since. Until this can be proven that it's ok to be removing 100 million pounds which is a ridiculous number to begin with. I think a foreign company should be stopped. The writing is on the wall for all to see that this is not good. Thanks

Along with a 50%reduction in the Chesapeake bay, there should be an equal reduction for menhaden in the ocean along the whole east coast.

I am in favor of substantially reducing the quota of the Menhaden capture fleet along the Atlantic coast, within the Chesapeake Bay, and other water that connect to the Atlantic Ocean.

I feel other organisms are suffering by the reduction of the pivotal Menhaden bait fish.

Thank you,
Brandon Davis

I support Atlantic Menhaden Draft Aaddendum 2. I believe a 50% cap and the quota periods will both help improve the population of Atlantic Menhaden, and therefore help the fish and birds who use this species for food. There has been a noticeable difference in wildlife around my area. This move will also help my local bait and tackle stores which have suffered financially because they were unable to keep Atlantic Menhaden in stock. Thank you for allowing me to submit this comment.

I want option c1a, b2, and reassessment in 3 years. Thank you for this very important opportunity to help the bay. I encourage you to ignore the claim that a lower bay cap could result in layoffs. This is classic fear mongering. The industry will simply shift it's fishing out of the bay and into the ocean.

I am writing to strongly support the adoption of the following options under Draft Addendum II. These measures will reduce the Chesapeake Bay's menhaden reduction harvest, build a smarter, more precautionary management system, protect menhaden when and where they are most important, keep Bay harvest limits tied to coastwide management, and ensure that management can adapt as new science becomes available. 3.1 Chesapeake Bay Reduction Fishery Cap Amount: - I support option C1e, which would reduce the Bay Cap by 50 percent and limit it to 13.6 percent of the Coastwide Catch Limit (TAC). I also support option C2a, which sets an upper limit of 51,000mt for the Bay Cap — which is the current level. 3.2 Chesapeake Bay Cap Distribution: - I support option B2, which establishes three equal-length quota periods for the Bay Cap, but distributes harvest as follows: 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. I also support option B, which establishes quota-period overage payback and rollover of unused quota within a fishing year. 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: - I support option B Revisit Provision, which would reassess the efficacy of these new management tools every 3 years. I appreciate the opportunity to comment on Draft Addendum II and strongly urge the adoption of the sections outlined above. Ospreys and hundreds of other bird species depend on healthy menhaden populations that are sustainably managed. This is best accomplished by adopting options 3.1, 3.2, and 3.3 in Draft Addendum II.

Thank you for considering my comments and for your commitment to responsible menhaden management. I hope we can all continue to enjoy this for generations to come.

Menhaden are one of the most important fish on the Atlantic Coast. They are a vital food source for the birds and fish that call the coast home. The Osprey population, however, has struggled in recent years, and it has become clear that a healthy menhaden population is critical to the health of these birds.
I support the following management options:
3.1: Options C1e and C2a. I support a precautionary reduction in the Bay Cap by 50% of the current 51,000 metric tons for the reduction fishery. This will help increase the number of menhaden available in the Chesapeake Bay, an important nursery for Atlantic menhaden.
3.2: Option B2. I support the establishment of three quota periods for the Bay Cap at a 25/25/50% harvest distribution percentage per quota period. This will help reduce food competition for birds like osprey during the most vulnerable times of their life cycles.
3.3: Option B. I support reviewing the Chesapeake Bay Cap every 3 years. This gives the Commission the ability to plan and react to changing conditions and new information.
These options best support the Chesapeake Bay and ensure the health of our birds, people, and planet.

Menhaden is not only important for the ecosystem, but for the entire fishing economy. As a recreational angler that spends a lot of time fishing, and a lot of money on tackle, bait, fishing license, hotels, restaurants, etc. I am all for reducing the commercial menhaden catch. Don’t be short sited, consider the big picture which ultimately affects everyone.

As a Maryland resident who cares about the long-term health of the Chesapeake Bay, I urge the Atlantic States Marine Fisheries Commission to adopt strong, precautionary measures to limit industrial menhaden harvesting within the Bay.

Atlantic menhaden are a critical part of the Chesapeake Bay's food web. They provide an important food source for striped bass, osprey, and other fish and wildlife. Removing large quantities of these fish for industrial reduction into fishmeal and fish oil raises legitimate concerns about the availability of this essential food source and the broader health of the Bay's ecosystem.

The Commission should prioritize the long-term sustainability of the Chesapeake Bay over maximizing short-term industrial harvests. I support a substantial reduction in the Chesapeake Bay reduction fishery cap, including the proposed 50% reduction option, along with measures to distribute harvest more evenly throughout the fishing season and prevent excessive concentrations of fishing effort.

I also urge the Commission to apply a precautionary approach when scientific uncertainty remains about localized menhaden abundance and the effects of industrial harvesting on predator species and other fisheries. Coastwide population assessments

should not be the only consideration when evaluating potential impacts within a specific ecosystem like the Chesapeake Bay.

The Bay is an invaluable natural resource, and its health affects Maryland's wildlife, recreational fishing, local communities, and future generations. Please adopt meaningful, science-based protections that ensure menhaden remain abundant enough to support the ecosystem that depends on them.

Thank you for considering my comments.

Comment

Dear Members of the Atlantic Menhaden Management Board:

I am writing as an avid birder and a frequent traveler of the Chesapeake Bay watershed to express my strong support for Draft Addendum II. I urge the Commission to choose the options that enact the maximum reduction—up to the proposed 50% cut—to the Chesapeake Bay Reduction Fishery Cap (Bay Cap) and to more strictly regulate the seasonal timing of industrial reduction fishing.

Every two weeks, my routine takes me across the Chesapeake Bay Bridge as I travel from my home to our family farm in Parksley, Virginia on the Eastern Shore. This regular journey gives me a front-row seat to the changing health of the Bay. Over the years, the joy of watching ospreys soar and hunt along this corridor has been increasingly overshadowed by a heartbreaking reality: empty nests and struggling populations.

As a cornerstone forage fish, Atlantic menhaden are the literal foundation of the Chesapeake Bay food web. They provide essential energy not only for sportfish like striped bass, but critically for local avian predators like the osprey. Decades of intensive, concentrated commercial reduction fishing within the Bay have created severe localized depletion. The localized

scarcity of this vital food resource has directly triggered unprecedented osprey nesting failures in the saltier portions of the Bay. Recent ecological research has clearly connected poor reproductive success and devastating chick starvation directly to food stress caused by a lack of available menhaden.
An ecosystem-based approach to fishery management demands that we protect these predators, especially during vulnerable nesting seasons. For ospreys to successfully nest and raise their young in the Bay and surrounding waters again, they need a reliable, abundant supply of menhaden in the water.

Therefore, I strongly advocate for the following measures in Draft Addendum II:
• A 50% reduction in the current 51,000 metric ton Chesapeake Bay Reduction Fishery Cap to alleviate total harvest pressure and allow local forage populations to recover.
• Stricter seasonal distribution of the cap to prevent the extreme concentration of industrial fishing effort during the summer months when osprey chicks are actively hatching and entirely reliant on parents for food.
• A responsive, precautionary framework that ties Bay harvest limits to coastwide ecological indicators and adapts seamlessly as localized data improves.

The Chesapeake Bay cannot continue to function purely as an industrial harvesting ground at the direct expense of its iconic wildlife. Preserving menhaden is essential to the survival of the ospreys that define the natural heritage of Virginia's Eastern Shore and the entire Bay ecosystem.

Thank you for your time, your leadership, and your commitment to safeguarding the long-term ecological health of the Atlantic coast. I strongly encourage you to approve a robust, conservation-forward Addendum II at your upcoming annual meeting.

Sincerely,

Christiane G. Hyland
Frequent Chesapeake Bay Visitor and Landowner in Parksley, VA

Yeah how about we limit the amount of menhaden harvested so we dont starve predators and start to destroy the food chain. No need to harvest as much as we do. We can chill out a little bit and still get what we need while still providing for nature rather than this maximum extraction mindset we seem to have lately in this country. Kinda stupid to pull more than we need. Thats not very efficient

Thank you for the opportunity to comment. At this crucial time, I urge you to take the most restrictive action to help the menhaden populations recover. Of the choices you have presented, I respectfully, urge you to vote for B4 - reducing the fishery cap by 50% (to 25,500mt), and Option B2 for an Even Length and Uneven Harvest (of 25%, 25%, and 50%) in order to delay the seasonal catch to give menhaden more time to breed.

The decline of menhaden has been reported to be a concern for many years, and the decline has become so substantial that it is now gravely impacting the fishing industry as well as wildlife and coastal economies. At the public hearings, one only needs to hear the comments of those involved in fishing, those who live in coastal towns, and those who monitor Osprey nests who report the obvious impact due to the lack of menhaden. I attended three hearings and the majority of attendees had deep concerns including few menhaden sightings and failing osprey nests. The Connecticut Audubon Society reported, "This marks the first time in Osprey Nation's 13-year history that the majority of successful nests only had a single fledgling." And that was just for the successful nests. They noted, "of 679 total nest attempts, 40% failed." That is astounding! In a single incident 20 of 25 nests failed. Similar reports were given by nest monitors all along the East Coast and many noted sightings of food stress as evidence of lack of food. Resources (menhaden) seem to be at an all time low and it is vital that action be taken now to preserve menhaden for future generations including for local fishermen, for other species that feed off menhaden, to preserve

the Osprey population and other species that rely on menhaden, and for the support of the economies of coastal towns.

Thank you for your attention to this important matter.

PLEASE pass Atlantic Menhaden Draft Addendum II.
Industry is trying to get us to believe that they are not having an impact on the menhaden biomass.
As a fisherman and conservation minded adult,
I scream HOGWASH!!!
The menhaden are so scarce in the CT River that you cannot count on the bass being in the river to feed on them.
Starving ospreys are scientifically documented.
I was around for the banning of DDT and watched as the ospreys and eagles rebounded,
Are we going to allow big business to put us through that again?
PLEASE pass this bill.
You know its the right thing to do.

Atlantic menhaden are the backbone of marine ecosystems up and down the entire eastern seaboard. From striped bass and tuna to ospreys, marine aquatic life rely on these menhaden for survival. Not to mention the tens of thousands of recreational, and commercial fisherman who also rely on their presence in the ecosystem, and in turn the economy that supplies these waterman and rely on the presence and effect of menhaden. If you have spent any time on the water in the last decade, or even the last year it is impossible not to notice the dwindling population of menhaden, and in turn the effect this is having on our beloved home waters. Ammendum II is a small step in the right direction towards continuing the restoration of our local waterways, fisheries, and marine ecosystems. They are far more than just a fish, they are the backbone of the Atlantic and they need to be treated as such

Sustainable fisheries are a vital part of the economy of the Chesapeake Bay and a key part of making sure this historic and beloved natural area - an American treasure! - remains safe now and in the future. The current take of menhaden is not sustainable. It is having a devastating impact on both the people and the place that I love and that means so much to so many Americans. Please take this opportunity to rein in the damage before it becomes irreversible.

I've been fishing the bay for years and the bait fish have drastically finished as well as the huge numbers of rock fishi we used to catch. There should be no large scale fishing of menhaden in the bay. It is the nursery for many species of fish and wild llfe . If they are so prvelant why have they declined? Go offshare like the rest of the east coast to find them. Fish oil is snake oil and serves no purpose . it's a scam. Make fertilizer out of trasth fish. catfish, carp etc. beyond time to end this stupidity.

Comment

My name is John Carlucci and I am a lifelong angler who grew up fishing in New England. Fishing was such a tenet of my upbringing that I spent 6 years in higher education earning multiple degrees in marine biology, fisheries science, and population dynamics so that I could better understand the species I care so much about. Foolishly, my hope was that my education would make me a better, smarter, more observant angler. Unfortunately, many of us have instead watched angling opportunities like those for striped bass become harder, less enjoyable, or disappear entirely because of failed management. It is a frustrating, soul tormenting, disenfranchising experience to invest so much time and effort into educating yourself to become a better angler only to see with great clarity when, how, where, and how many times ASMFC management plans have failed, robbing us of our angling opportunity.

For the past 12 years I have lived in Maine watching the bad and the ugly of ASMFC's poor management unfold in front of me and in short order. I'd encourage every member of the board and anybody who takes the time to read this comment to conduct this simple mental exercise: How many of the 27 species managed by ASMFC are considered healthy and well managed or rebuilt? Of those, how many of them depend on menhaden as a forage base? If you're unwilling to do the work on those word problems I'd be happy to give you a hint - it is an integer less than 1. For each of those species that depend on menhaden, how many rebuilding timelines have been exceeded without success? What we are discussing in this addendum in addition to

the separate coastwide TAC is REDUCING the cap so that the probability of exceeding the ecological fishing target falls FROM from 99.5% TO somewhere between 40% and 50%. Let's flip the script a bit. If you took your life savings to a financial advisor and they told you there is a 99.5% chance of loss on your investment every year, would you invest? If they said, "We made some changes and now the probability of loss is 40-50% per year," what then? What I find appalling is that both scenarios are complete garbage. We are talking about reducing the cap so that exceeding the ecological target is no longer a guarantee, it's a coin toss. Think about that, please. Right now, all we are asking for is a coin toss of success.

Here in Maine I have the pleasure and the privilege of seeing menhaden completely black out a fish plotter, but that does not mean all is well. I do see the lack of striped bass, I see bluefin tuna shifting their behavior because herring are already gone. We seem to be stuck in this cycle of fishing out the foundation of the Atlantic food web. We've gone through herring, we're going through menhaden. How many keystone species can we fish to oblivion before the entire system no longer has a foundation to support it? If the strategy is to just keep moving to the next species, what is the next species after menhaden? As scientists, we are held to the standard of conducting the best possible science so that managers can manage on the best available science. Sometimes scientists get it wrong, I'll be the first to admit that. Why does management get to choose when, or if, it is convenient to implement the best available science when the science is wrong and the scientists rectify the mistake?

What has been done to manage this fishery has not worked. What is being done to manage this fishery is clearly not working. The ASMFC is meant to conserve our natural resources in a way that supports commercial stakeholders, recreational stakeholders, and most importantly, the entire Atlantic ecosystem - the single largest, voiceless stakeholder of them all. So far, we've watched the commercial fleet send spotter planes hundreds of miles to find fish because they're so locally depleted. We're watching guides and anglers change target species, sell off boats and gear. We're seeing tackle shops shut their doors to their local community because that local community has nothing to buy tackle for. We're watching species in the ecosystem—the very ecosystem that the ecosystem-based fisheries management plan for menhaden is meant to protect—decline dramatically. Where is the threshold for damage before we decide on proactive management? The fact that I am asking what the threshold on damage is when the ASMFC's sole purpose is to prevent that damage entirely is as asinine as it sounds. We all need a change now, the future of this fishery and those which depend on it needed that change years ago. If this is the best we can do, which I doubt to be the case, I support the following:

I support option B4 cutting the Bay Cap by 50 % (51,000 mt to 25.5 mt)
I oppose option C tying the Bay Cap to the coastwide quota
I support option B1 for three evenly split quota periods with underage sub-option 1
I support option B revisiting the cap every three years

A cut to the Bay Cap is conservation. It is not quota to be moved to another state. I'd consider this one step in the right direction with a long way to go, but please take that step.

Dear Members of the Atlantic Menhaden Management Board,

I am writing in strong support of a meaningful reduction in the Atlantic menhaden total allowable catch. I have spent roughly three seasons boating the New York Bight, logging more than 200 hours on the water each season. What I have seen over that time concerns me, and I believe it reflects a larger management problem.

Menhaden must be managed as one connected system.
Menhaden and the predators that depend on them do not stay inside state lines or between estuary and ocean. Fish move from estuarine waters to the open ocean and back as part of a single life cycle, and they cannot be divided into separate management zones. A reduction in one area should therefore be a reduction overall. If harvest is cut in one place but simply shifts or expands elsewhere, the coastwide population gets no relief. I also share the concern that fish protected in the EEZ off New York and New Jersey could be landed in Virginia. Conservation measures need to be applied to the population as a whole.

What I have observed on the water.

- Fewer menhaden pods offshore. Within my territory, 30 to 40 miles offshore, I have noticed a clear reduction in the number of menhaden pods.
- Dolphins in the estuaries. Dolphins appear to be coming into the estuaries more often, which I believe is a response to a lack of forage in the open near-shore waters.
- Osprey. I have seen a clear decline in nesting osprey, or a change in their feeding habits, with more birds working the stocked trout waters around the New Jersey shore.
- Cormorants. Cormorants preying on freshwater fish seem to be increasing.

These are anecdotal observations, but together they point in one direction. When the forage base in the ocean is depleted, predators adapt by moving into other waters and taking other prey. I believe the mismanagement of menhaden and the scale of the industrial harvest are affecting the entire Mid-Atlantic and New York Bight ecosystem.

Allocation is not equitable.
I am disappointed that allowance is not distributed more evenly among the states. Under the current structure, the economic opportunity from this resource is effectively concentrated in Virginia, while states like New Jersey and New York bear the ecological and recreational costs without a meaningful share. States should receive larger allocations so that the benefits of this fishery are not captured almost entirely by one state.

What I am asking the Board to do.

1. Reduce the harvest to sustainable levels. The goal should be an overall reduction that supports a healthy, abundant population and the ecosystem services that depend on it.
2. Manage by fish counts, not just pounds. One hundred million pounds of menhaden can mean 50 million adult fish or 200 million peanut bunker, and those are not equivalent. Harvest limits should protect adult spawning-age fish and account for the age structure of the catch.
3. Adopt seasonal allocations. As with tuna, spreading the harvest across the year would limit pressure during critical periods of spawning and migration and allow natural processes to function.
4. Set strictly managed bycatch limits that take precedence over menhaden harvest. The menhaden fishery should be required to stay within tightly controlled bycatch allowances.
5. Rebalance allocations among the states. Larger allocations for other states would better reflect the resource's range and value, and would ensure the economic opportunity is not effectively limited to Virginia.

Menhaden are among the most important forage fish on the Atlantic coast. Striped bass, bluefish, tuna, whales, dolphins, and birds all depend on them, and so do the recreational and commercial fisheries of every state along the coast. I urge the Board to take a precautionary, ecosystem-based approach and to act on these recommendations.

Thank you for your time and for considering my comments.

My wife and I are writing in support of Draft Addendum II.
We believe any and all efforts to address the depletion of menhaden are critical to the survival of waterfowl (particularly ospreys) in our area. We support research efforts in order to sustain our environment that allows forage fish to thrive in our waters and thus maintain a healthy and growing osprey population.

With our thanks for your efforts to support and act on Draft Addendum II and other efforts to address this crucial issue post haste.

Our local water of CT has seen a drastic reduction of adult menhaden over the last 10 years, 20 years, 30 years. I am born and raised and reside in Rowayton CT. My father moved to Rowayton in 1958. He loved fishing in LI sound and i do also. LI sound is as clean as it has been in years, proper public awareness of what we put on our lawn, what goes into our storm drain all matter. The local population of Osprey has increased exponentially after DDT killed everything in the water & our Osprey population. Now the lack of menhaden in our local waters in killing the Osprey. I remember the Bunker Boats that were allowed in LI Sound years ago....finally they were banned from depleting the local schools...only to deplete the menhaden before they even get to LI sound.

PLEASE REDUCE THE CAP BY 50%

I am opposed to the reduction fishery of menhaden in Chesapeake Bay. I understand that it will continue despite my opposition because of the money interest and political clout that they exert over the organizations involved in regulating them.. I only hope that some sensible regulations are implemented to reduce the amount of fish taken out of the bay are implemented. I am not a scientist. I am a Fisherman. I'm 73 years old. I grew up, casting into schools of rockfish feeding on alewives covering acres of the bay around Annapolis and points south. They are gone fishing sucks. I have Waterman friends who cannot catch bait in their nets any bigger than their hand. Last year, one of them could not catch any bait. He hoped his oyster lease was gonna help him out but now the oyster market sucks.. so you're gonna worry about a 500 employee business from Canada over all the small Waterman up and down the Chesapeake Bay making a living and spreading their money up and down the bay over one big company because they're lining your pockets. That's my opinion.
Thank you, John Popow

The menhaden is the most important bait source on the eastcoast .
It provides numerous independent businesses with the ability to service the fishing public.
Coupled to providing the primary source of food for our local game fish .
Almost all our local species feed on this bait in order to survive in most cases .
Allowing a foreign company to fish commercially in our waters and decimate this important species is totally unacceptable!

I am a resident of Virginia, but I also maintain a home on the West River, a tributary of the Chesapeake Bay, in Maryland. While my observations are anecdotal, the changes over the last few years have been so severe that they are obvious to even the casual observer. And I believe others have legitimate scientific research to back them up.

I've owned a boat and fished regularly in the Chesapeake Bay, from Solomon's Island north to Annapolis some 1987. Until recently, one regularly encountered large schools of menhaden in those areas. In recent years, it has been rare to find any adult/larger sized menhaden, no bait balls, no visible schools. The absence is clear, and it seems reasonable to attribute the drastic decline in the quality of striped bass fishing at least in part to this absence of bait fish. It certainly is a major contributor.

More troubling is the sudden change in the osprey population nesting in the area around the West River. Only three years ago, virtually every nesting platform or channel marker had a nesting pair of osprey with at least two chicks. Starting last year and worse this year, about 3/4 of the platforms and similar sites were empty. Where there were birds, we saw no chicks.

A drive down the Western Shore of the bay past hundred or thousands of boats should give one an idea of the importance of Sport fishing to the economy of the area. I can no longer invite guests with a reasonable expectation that we will catch any

fish. That has only been the case for the last three to four years.

Action must be taken to significantly reduce the offtake of menhaden in the Chesapeake bay and surrounding area by one large corporation.

Please take action now before the fishing crashes further and we lose the wonderful osprey population.

James Boyle
Atlantic States Marine Fisheries Commission
comments@asmfc.org

Subject: Atlantic Menhaden Draft Addendum II

My name is John Tinsley and I am a recreational angler in Virginia. I fish the Rappahannock River, including the tidal river from the mouth up to buoy 10. I am writing as a private angler, not for a club or company.

I support Option C with sub-option C1e and sub-option C2a on the Bay cap amount; Option B with sub-option B2 on quota periods; and Option B on the revisit provision.

Industrial reduction fishing in the Bay has changed how, and how often, I can fish the Rappahannock. The river fishes when menhaden are in it. Striped bass, bluefish, speckled trout, puppy drum, and Spanish mackerel show up behind those schools. When the schools are gone, the predators are gone, and a day that used to be a matter of finding birds and bait becomes a

long ride for very little.
That lines up with the timing problem this addendum describes. The reduction season runs from the first Monday in May to the third Friday in November, which is the entire recreational season on this river. In 2023 and 2024 more than half of Bay reduction landings came in a six-week stretch in midsummer. Those are the weeks the Rappahannock should be at its best. Instead I have watched the bait disappear in a short window, birds quit working, and the fish I came for leave the stretches I have fished for years.
The Bay cap was meant to keep that from happening in a nursery system. At 51,000 mt it no longer does that job. It has not moved while the coastwide TAC has, including the 20% cut in 2026, so a larger share of the coastwide catch can now come out of the Bay. Pound-net catch per unit effort in Maryland, Virginia, and the Potomac River Fisheries Commission dropped in 2024, Maryland's harvest was down sharply from the 2018–2022 average, and fishery-independent indices fell off in 2024–2025. Striped bass are overfished. I do not need a coastwide stock assessment to tell me the forage those fish follow is not reliable in this river in summer.
C1e puts the Bay cap at 13.6% of the TAC, about 25,500 mt under the current TAC, and keeps that proportion so a future TAC cut actually reaches the Bay. C2a keeps the cap from climbing back above 51,000 mt and does not set a floor that would block a deeper cut later. A one-time 50% cut under B4 would help, but it repeats the mistake this addendum is trying to fix: a fixed Bay number that drifts out of line with the coastwide quota.
On timing, B2 is the option that matches the problem on the water. An even-length split that holds the first two periods to 25% each, and leaves 50% for after mid-September, is the only choice that pulls meaningful harvest out of the late-spring and summer weeks when recreational fishing, and predator feeding, depend on those fish being in the tributaries. Status quo, and to a lesser extent B3, leaves the midsummer pulse in place. Equal thirds under B1 is better than nothing, but it still allows a third of the Bay cap in the worst weeks.
I also support revisiting the cap at least every three years. The Board is being asked to act while Bay-specific research is unfinished. That is a reason to take the precautionary cut and the seasonal split now, and to look again when the research is in, not a reason to wait.
The reduction fleet can still operate. These options change how much comes out of the Bay and when. Leaving the cap and the timing alone continues to put the cost on the rest of us who fish the Rappahannock for food and sport rather than for meal and oil.
Thank you for the chance to comment.
John Tinsley

I support the strongest proposed conservation measures, which are the following:
- 3.1 Chesapeake Bay Reduction Fishery Cap Amount - Option C1e: that reduces the CAP by at least 50 percent in 2027 (25,500 mt) and limits the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).
- 3.2 Chesapeake Bay Cap Distribution - Option B2, which establishes three even length quota periods for the Bay Cap, but distributes harvest 25% in period 1, 25% in period 2, and 50% into period 3.
- 3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision - Option B to revisit the Bay Cap every 3 years.

Our family has been boating and living along the Chesapeake Bay for more than 20 years and we have a deep connection to the waters and ecosystems of this area. As the largest estuary in the United States, the Chesapeake Bay is a critical breeding and nesting ground for many land and water species along the entire eastern seaboard. While I understand there are many environmental stressors the Bay must endure, the massive harvests of menhaden is a contributing factor to the decline in critical species such as the osprey and striped bass.

We have an osprey nest at the end of our dock and this summer was the first time in more than ten years the osprey offspring did not survive. While this is anecdotal, it is consistent with other data which shows widespread osprey productivity declines. I

believe it's in part due to a lack of small menhaden in the late spring when they are needed by the osprey to feed their hatchlings. The osprey are starving. In the late spring/early summer, we used to see large schools of menhaden in the waters off our dock, but this year they did not come until late in the summer, after the osprey chick(s) had died.

These declines signal an URGENT need for precautionary conservation practices NOW. Industrial reduction fishing extracts over 100 million pounds of fish in a concentrated summer window, harming the local food web and depriving other groups, especially watermen and anglers, of fair access. We urge fishery managers to implement strict quota periods that will distribute the harvest evenly across the year rather than allowing an intense summer harvest.

While I agree with the need for a broader study that has been funded by the state of Virginia, we cannot wait for the results to take action. We must limit the menhaden harvesting as much as possible NOW and once the results of the study are available, a more permanent plan can be determined.

I am a recreational fisherman and boater. I have seen a number of changes in the quality of the water, SAV, birds and wildlife over the last 20 plus years. The YOY study reports for the last 5 years have demonstrated a significant decline in Rockfish reproduction. In 2023 I noticed fewer schools of Menhaden in the Eastern Bay and Miles River areas. Likewise in 2024 and 2025 even fewer. Now in 2026 I saw none. Another signal which cannot be ignored is the decline in ospreys on the Chesapeake Bay as they also rely on the Menhaden for their diet. Another “study” is not needed to prove that a very aggressive limit on the commercial Menhaden reduction industry is needed NOW. This isn’t just a Maryland responsibility even though the Chesapeake Bay is considered by many as the key player in this debate. Virginia has to also do their part. And looking at how states from Massachusetts to North Carolina manage their resources needs better control. Thank you for considering my comments.

I am a resident of Connecticut and am writing in full support of Draft Addendum II to implement a precautionary reduction in the Chesapeake Bay menhaden fishery cap. Atlantic menhaden are a vital keystone species that support top-tier predators, particularly ospreys.
Widespread osprey nest failures and chick starvation along the East Coast indicate severe localized depletion of their primary food source. The ASMFC must act to reduce the industrial harvest cap by 50% to ensure enough forage fish remain in coastal waters to support sustainable breeding pairs.
Ospreys serve as an early-warning system for the health of our oceans and coastal waters. The sharp decline in fledgling success rates, such as those tracked by Connecticut Audubon's Osprey Nation, proves that current industrial fishing pressures are out of balance with ecosystem needs.
Protecting ospreys requires looking beyond individual nests to the health of the entire food chain. I urge the Commission to enact stricter regulations to safeguard these birds from starvation.

Please choose to curtail harvesting of Atlantic Menhaden at current levels at all costs. I as an independent and individual fisherman have noticed considerable decrease in the volume of Atlantic Menhaden during this past decade if not longer. The vast schools that would appear in the spring through the late fall migration is significantly less than ever before.

The smaller volume of Atlantic Menhaden this summer has impacted fishing off the surf and boating areas of the NJ Shore. This currently impacted the Osprey population and number of offspring they generate. They are starving. The volume of fish that forage during the migration has dwindled significantly. This needs correction and quickly.

For too long we fishermen on the surf and private boats have been given mandates of how many fish we can harvest and when depending on size restraints. Science has blindly led us down a path to recovery that continues to evade recovery.

It’s common sense to me to cut back on the amount of allowances given to the commercial industry within the Chesapeake Bay and Atlantic Coast. It appears to we fisherman that industry is eliminating the Atlantic Menhaden stock with care of the stock’s future. The industry has the appearance the stock is collapsing or has collapsed beyond recovery. If that’s the case shame on them for ruining it for fishermen. They have raped the stock for their own profit with no regard to science, the stock,

or environment.

I implore you to use common sense to do what is right for the preservation and propagation of the future stock. If you do not use common sense and allow the commercial take to continue unhampered you will be viewed as responsible for the demise of the Atlantic Menhaden. I wish you well with your decision.

The reality of the negative effect of the menhaden fisheries abuse within the Chesapeake estuary is blatantly obvious. The fact that this level of excessive commercial fishing is taking place in an estuary defies any logic or good science. With modern technology and drone/aircraft - this abusive fishing is far too easy for the commercial entities and very damaging to the estuary's entire ecosystem. Limit any menhaden commercial fishing (seining) to outside the mouth of the Chesapeake and then reduce the overall quota to a more sustainable level for the species that depend on menhaden for their survival. No business or amount of money is worth damaging the estuary that has been decimated by commercial operations in the past and is struggling to recover. Get Virginia under control and change the laws/regulations. Reduce the quotas and/or work towards getting the seines out of the Bay all together. Catch the menhaden after they leave the bay and outside for the state waters. Move the purse seine operations to the EZZ like other fisheries.

Menhaden. A vital part of our fishery and bird life. Harvesting should be greatly curtailed before it's too late.

Menahaden is the most important fish in the ocean and we are loosing them!!! Changes need to be made to protect these fish in order to keep our natural resources ALIVE! This is insanity that we need to even come together to discuss what we all know. WE NEED THE BUNKER! AND THEY NEED OUR HELP TO DO IT.

I strongly support updating menhaden limits to reflect biological criteria. Taking into consideration the needs of stripedbass, Osprey, bluefish and other inhabitants of the Bay is critical. Just the economic value of fishing in the Bay way offsets any costs associated with additional controls placed on the commercial fishery.

I am very concerned about the negative impact on Osprey reproduction in the Chesapeake Bay and along the Atlantic coast of New Jersey. This has caused plummeting of Osprey populations and is due mainly to overharvesting of menhaden. I request major reductions in menhaden catch limits. Thank you for your consideration in halting this major environmental impact.

I support CCA Virginia's proposed changes to the Atlantic Menhaden Draft addendum II.
Specifically,
The Chesapeake Bay Cap should be set at a different amount than is currently specified. We recommend Option C – Link the Chesapeake Bay Cap to the coastwide total allowable catch (TAC).
The Chesapeake Bay proportion of the TAC should be Option C1E – Set the Bay Cap at 13.6% of the coastwide quota, initially equivalent to a 50% reduction from the current cap.
The upper and lower limits of the Bay cap would be best served by Option C2A – Establish 51,000 metric tons as the upper limit, with no lower limit.
The Bay Cap should be divided into 3 quota periods to moderate reduction fishery landings in the beginning and middle of the reduction fishery. This would be best accomplished by Option B2 – Allocate 25% of the Bay Cap to the first quota period, 25% to the second, and 50% to the third.
Overages and underages within a quota period would be best addressed by Option B – Require quota-period overage paybacks while allowing unused quota to roll into the final period of the same fishing year. Any underage in Quota Periods 1 or 2 should be rolled into Period 3 of the same fishing year. Any underage in Period 3 should not roll over into a future fishing year, an approach that is consistent with precautionary management.

The ASMFC Board should set a timeframe for periodically revisiting the Bay Cap measures. We support Option B – Require ASMFC to revisit the Chesapeake Bay Cap every three years. However, this requirement should be modified to include “or sooner as may become necessary by changed conditions.”
These options provide a reasonable balance among competing interests under current resource conditions. Their adoption would reduce ecological and economic risk while allowing management to adapt as new Chesapeake Bay-specific science becomes available.

While studies to assess menhaden abundance in Virgina’s Chesapeake Bay waters are an important next step to guide management, we encourage the Board to act now to strengthen precautionary measures to mitigate the risk of long-term harm to the menhaden predator-prey relationships in the Chesapeake Bay ecosystem.

This includes a return to managing the coastwide TAC at levels that will achieve a 50% or greater probability of achieving ecosystem-based fishing mortality target.

Board members must also recognize the ongoing economic effects associated with this species including not only those that pertain to the coast wide menhaden fishery, but also to the sportfishing and commercial fishing sectors that rely on predators which rely on menhaden as forage or menhaden as bait.

Overall, the extraction of menhaden in Virginia Bay waters by intense, concentrated commercial reduction fishery harvesting without a sufficient scientific basis to support such harvests exacerbates the risk of long-term harm to the food web and forage base-predator relationships in the Chesapeake Bay. Therefore, we respectfully request that the Board select the options we prefer as they trike a reasonable balance under the present circumstances among the competing interests in the Chesapeake Bay menhaden fishery. Adoption of these options would help mitigate the risk of adverse environmental and further economic effects.

Am a 11th generation Virginian/Marylander and family were oysterman for generations …and a one was an officer during the oyster wars! I grew up on the bay and currently live in Williamsburg on the James. I've seen all sorts of challenges throughout my life.
We've always had nesting Osprey families. The last two years there are none!. Not at our house. Not in anyplace up and down the James.
(Including channel markers and any other previous nesting sites.). That I've seen and what
Others Have reported.
This is a symptom of a system out of balance. (There are other factors in the Bays health and prosperity.). This is urgent, and time is running out.

I strongly support reducing the Chesapeake Bay reduction-fishery cap by 50 percent—from 51,000 metric tons to 25,500 metric tons per year—and establishing strict seasonal quota periods for menhaden. The Chesapeake Bay is too important, and the ecological warning signs are too serious, to continue managing this critical forage fish as though the timing and location of harvest do not matter.
I have lived in St. Mary's County since 2008 and am lucky enough to have an osprey nest just off my pier. We used to have two to three chicks annually fledge and migrate at the end of the season. Now, we are lucky to have one chick and the last three years they have all starved before fledging.
The evidence points to a decline in the number of menhaden that the ospreys, striped bass and other marine life in the Chesapeake watershed depend upon for their survival.

It is both when and where those fish are removed that matter. A menhaden harvested from a concentrated school in the Bay during the summer is no longer available to the predators that depend upon that school. Concentrated removal can create localized depletion during a biologically important period and can affect the availability of forage to other users of this shared public resource.

The consequences extend beyond the reduction fishery. Menhaden support the Bay's recreational fishing economy, commercial and charter fishermen, watermen, wildlife, and coastal tourism. One user group should not be permitted to concentrate an enormous harvest of a shared forage resource during the period when that resource is most important to the rest of the ecosystem and to other Bay users.

For that reason, I urge the Commission to take the following actions:
• Reduce the Chesapeake Bay reduction-fishery cap by 50 percent to 25,500 metric tons annually.
• Establish strict seasonal quota periods that distribute harvest throughout the year rather than permitting an intense summer harvest.
• Apply a precautionary management approach in light of uncertainty regarding localized menhaden abundance and the ecological condition of the Chesapeake Bay.
• Give greater consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the broader Chesapeake Bay economy, not just one Virginia based fishing company.

The Chesapeake Bay is not simply a location on a fisheries management map. It is a complex and interconnected ecosystem, and menhaden are one of its essential links.
We should not wait for further deterioration before taking action. There is no time for additional five-year studies to delay the decision. The severe drop in nesting pairs and the lack of surviving chicks will not replenish the specicies enough to survive that long.

As someone who lives here, fishes and sails these waters, swims in them, and cares deeply about the wildlife that depends upon them, I believe the Commission has an obligation to manage menhaden conservatively and to recognize that the health of the Bay must take precedence over maximizing a concentrated industrial harvest.

Reduce the cap. Establish meaningful seasonal quotas. Protect the forage base. Give the Chesapeake Bay—and the people and wildlife that depend upon it—a greater margin for recovery.
Thank you for your consideration.
Sincerely,

Marshall D Anderson

Hello, I am an Osprey Steward for the CT Audubon for 5 different nests in the Branford and East Haven area of CT. I have been doing this for about 8 years. I have watched the Osprey struggle with so many different aversions over the years with storms, predation, extreme heat, human interference. But nothing has come close to how difficult this season has been for them.
Last season I started noticing a dwindling number of fledglings where most of my nests previously had two or three successful fledglings, last season I was seeing more in the area of one or two. All of the adult activity seemed to be fairly similar to other years, but the successful number of fledglings had dropped. The other thing I started noticing last year was the lack of activity of fish in the water. I live right on the water where the farm river meets Long Island Sound. There has always been so much activity on my beach and along this area based on the running of certain types of fish, especially the bunker or menhaden. I could always tell when the big blue were running because the water would start percolating at certain times of the season with the bunker fish just leaping out of the water, while the blues were chasing them. I started seeing so much less of that last year. I had to search out small areas of percolation. This year it was pretty non-existent at all. I never saw any running of the blues or chasing of the Menhaden or the water percolating with their activity. I saw very few Egrets and great blue heron hanging out on the edge of my beach, waiting for the fish to be jumping. The gathering of many types of shorebird when the fish would get pushed in by the blues was always an amazing thing to watch. There would be hundreds of them. A lot has changed this year,

there were only scatterings of these shorebirds, and they were usually wandering up and down the beach, looking for fish, often unsuccessfully.
Watching the osprey nests that I monitor this year has been one of the most depressing things I've ever had to do. The adults laid the eggs in what seemed like normal numbers, and the little heads started popping up in the nest in what also seemed like normal numbers. And then they started dropping away rapidly. The adults were exhibiting much different activity than they used to. Both adults would leave the nest way more frequently for extended periods of time off trying to find fish.. The females would sit on the nest, calling and calling and calling for the males to no avail, and would then end up leaving the nest themselves. Very often they would both come back with nothing. Or sometimes with very small fish or different types of fish and not very often Menhaden. I do not have cameras on my nest, but I do watch the cameras on some of the other monitors nests and watching the siblings fighting with each other over food was very disturbing. Watching the smaller siblings slowly die off or get beaten down until they died off by their own siblings was very disturbing. I saw several of my adults in my nests dump dead carcasses over the side of the nest. I had never seen that before. I had one nest start with four nestlings and ended up with none. I had another nest that started with three nestlings and ended up with none. I had another nest in another preserve that started with three nestlings and ended up with none. in another nest, in the same preserve, started with two nestlings and ended up with none. I had one final nest in this preserve that started with three nestlings. They were fairly late in the season. I don't know if it helped that they were late, but the male seemed to be a lot better at finding food. Perhaps because so many of the other adults were already leaving. But again, they started with three nestlings and only one made it to fledge stage. He did pledge. I watched him trying to learn how to fish and fly with the mail while the female adult took off for migration. I did not feel as though he was being very successful with fishing. I never saw him catch anything himself. But the adult male kept trying very hard to teach him, and then after a while I didn't see any sign of either one of them, so I am hoping they were able to takeoff on a successful migration, but I don't feel as though this fledgling was very well prepared as others have been in the past. And he is the only one that I have that made it out of the nest.

It was extremely obvious that the problem was food. The adults were constantly leaving the nest and circling and trying to find something, and they were stealing food from each other's nests, which I had not seen much of at all in the past. I never saw them pick up a dead fish before, and yet when I found a dead bunker in my driveway, I decided to give it a try, and I put it down at the edge of the water so that the waves would move it back and forth. It looked fairly fresh, like one of the osprey had dropped it, which they frequently do. Sure enough, I saw something I had never seen before when one of them came in and took the dead fish. I had never seen them pick up a dead one before.

The behavior of the osprey this year is not sustainable. The numbers coming out of our organization are terrible.. They have sent their reports into you, and I am just telling you of a personal observation. This has been the most depressing season ever, and it is especially disturbing to think that it can be so easily fixed if it is in fact caused by overfishing. All of the warnings that came up from the Chesapeake Bay area last year told us this was going to happen, and they were right. So now that we know this is yet another human problem, please do your best to correct this quickly. I don't even know how many of these birds will be back next year, as I don't feel like they were very well prepared for migration.. Let's not end up in the DDT problems again. Let's fix this problem right from the start, and please lower the numbers of bunker that can be taken. It was not just the osprey that were affected. I saw it affecting so many other waterbirds throughout the season. It is very sad that humankind is often the cause of so many problems in the natural world. Let's do our part to stop it now. Thank you for letting me submit my personal observations.. Karen Smith

I'm asking the Board to manage menhaden for abundance: for the striped bass, bluefish, osprey, whales, anglers, bait fishermen and coastal businesses that depend on them.

For Draft Addendum II, please reduce the Chesapeake Bay reduction-fishery cap by 50% to 25,500 metric tons and distribute that harvest evenly through the season.
And when the Board sets the 2027–2029 coastwide TAC in November, please use the updated Technical Committee projections and the newest available science to make a meaningful coastwide reduction at least 30% from the current TAC, and more if needed to reach the ecological target. Especially since the science has shown error in the 2025 stock assessment, and new evidence has emerged it could be even greater.
We need both actions. Protecting forage in Chesapeake Bay AND reducing pressure from the coast."

The time for studies is over. Now is the time to end all large scale commercial harvesting of menhaden in the Chesapeake Bay and its tributaries. Having lived on and fished in the Chesapeake Bay and lower Potomac for over 20 years, the decline of all species, bird, fish and sea mammals that feed and depend on menhaden is clearly evident. End it now and save the ecology.

Comment

I would like to speak at your Annual Meeting in November.

My name is Philip Sugar, and I am speaking today on behalf of the thousands of waterman and recreational sports fishermen who love and protect the Chesapeake Bay.

For years, state and federal managers have placed the burden of conservation squarely on the shoulders of the everyday angler and waterman. We are told to cut our bag limits, measure our fish down to the exact fraction of an inch, and stay home during seasonal closures. We are told that every single striped bass counts.

But as a pilot who flies a Cessna over this Bay, I have seen the reality from the air. While regulators micromanage the recreational angler and waterman, industrial purse seine boats operate with staggering efficiency. It is like shooting fish in a barrel, stripping entire schools of menhaden out of the water in a single haul.

Let’s look at the simple math of what we are arguing about:

The Angler's Impact: When a sports fisherman keeps a single, healthy 10-pound striped bass to feed their family, or a waterman to protect their way of living and life that is a drop in the ocean.

The Industrial Impact: The industrial reduction fishery pulls 112.4 million pounds of menhaden out of the Chesapeake Bay under the current cap.

That 10-pound sport fish is equal to a single thimble full of water. The industrial reduction fishery is a massive, 15,000 gallon olympic swimming pool being drained right next to it.

Our recreational and commercial restrictions are meaningless if you allow a single corporate entity to wipe out the entire caloric foundation of the Bay. The 112 million pounds of menhaden taken by the reduction fishery could theoretically feed up to 7.7 million resident striped bass for an entire year. You cannot restrict the catch of predators on one hand while allowing the complete stripping of their food source on the other.

It is time to look at the scale of destruction. On behalf of all waterman and sports fishermen, I strongly urge the Commission to enact the full, maximum 50% reduction to the Chesapeake Bay harvest cap under Draft Addendum II. Stop policing the thimble while turning an eye to a swimming pool.

Please see my documentaries of the waterman of Southern Dorchester done in conjunction with seven time emmy winning producer Larry Engel.

Thank you.

Dear Ms. Berger and Members of the Atlantic Menhaden Management Board,
I am writing as a recreational angler from Mullica Township, NJ to voice my strong support for the ecological protections proposed in Draft Addendum II to the Atlantic Menhaden Fishery Management Plan.
Atlantic menhaden play a critical role as a foundational forage fish. In the Chesapeake Bay, they are vital food for economically and ecologically important predators, including striped bass, bluefish, and vulnerable shorebirds like ospreys.
I strongly urge the Board to adopt options that reduce the Chesapeake Bay reduction fishery cap by the maximum proposed 50% and establish strict quota periods. The current cap does not adequately account for the localized depletion happening within the Bay, leaving predators struggling to find enough food during critical life-cycle stages.
Implementing precautionary management tools, such as seasonal or area closures and a reduced harvest cap, is necessary to prevent further ecosystem destabilization and ensure the long-term health of our coastal fisheries.
Thank you for your time and for considering the ecological importance of menhaden in your final decision.
Sincerely,
James Brownhill

I am a Delaware and Maryland home owner. The 50% reduction is not enough! We need to save the infrastructure of our bay and our coast. As a homeowner on the Delaware coast, I have been absolutely distressed not only at the sight of empty Osprey nests, but I feel the entire ecosystem of the ocean has been impacted. I see few birds of any species feeding, see zero evidence of menhaden.. Sitting on Delaware's beach, the ocean is silent.

Hi. I am very concerned about the loss of the osprey population due to the depletion of menhaden. We need stricter limits on how many menhaden can be caught so we can protect the osprey and the ecosystem at large. I support further restrictions on the number of menhaden that can be harvested. Thank you

The issue of limiting Menhaden catch has been exhaustedly debated on both sides. Common sense and even a cursory examination of the evidence argues strongly for SOME type of greater limitation on the Menhaden catch. Please tale action quickly in limiting the catch and preserving this vital resource.

Menhaden are a backbone of the Chesapeake Bay. As critical filter feeders and the primary forage fish for striped bass, osprey, and marine mammals, their ecological value far outweighs their reduction value. Single-species metrics ignore localized depletion. Please implement stricter, ecosystem-based caps on the Bay reduction fishery to protect our multi-billion-dollar coastal economy. The actions recommended by CCA should be highly considered.

I strongly urge ASMFC to maintain the current 51,000-metric-ton Chesapeake Bay Reduction Fishery Cap under Option A and not impose an additional reduction without a demonstrated biological need. Draft Addendum II itself acknowledges that there are currently not sufficient scientific data to comprehensively characterize menhaden abundance and distribution throughout Chesapeake Bay or determine the influence of fishing pressure on that availability. At the same time, ASMFC's 2025 assessment concluded that Atlantic menhaden are not overfished and overfishing is not occurring, and the coastwide TAC has already been reduced 20% for 2026 to 186,840 metric tons, a level projected to have a 0% probability of overfishing in 2026. Recent coastwide reduction landings averaged approximately 129,000 metric tons from 2020 – 2024, dramatically below historic harvest levels, which exceeded 300,000 metric tons annually during portions of the 1970s and 1980s and peaked above 700,000 metric tons in the 1950s. Further Bay-specific restrictions should be based on measurable biological need, not simply the assumption that less harvest must produce a better ecological outcome.
Menhaden are unquestionably an important forage species, but the Chesapeake Bay food web is far more diverse than much of the public discussion suggests. USGS information presented to ASMFC shows that osprey diets vary substantially by location: at Poplar Island, striped bass represented 48% of the diet compared with 44% menhaden, while in lower-Bay estuarine areas spotted seatrout represented 29% compared with 24% menhaden; in the upper Bay and Susquehanna, catfish and gizzard shad dominate. Likewise, the Chesapeake Bay Program's forage analysis identified 11 "Key Forage"

groups and listed menhaden separately among several “Additional Important Forage” species. More importantly, ASMFC’s Ecological Reference Points already account for predator needs. ASMFC states that striped bass and osprey are among the predators most sensitive to menhaden fishing and that ERPs designed to provide adequate forage for striped bass would likely also avoid declines in other predators, including osprey. ASMFC also states that even eliminating all menhaden fishing would not, by itself, rebuild striped bass. Long-running VMRC and PRFC condition sampling summarized in the materials includes nearly 100,000 striped bass since 1990 with no year indicating food stress, while Maryland’s juvenile surveys found 2023 and 2024 menhaden abundance at its highest levels since 1990 and found menhaden widespread throughout the Bay for a third consecutive year in 2025.

The economic consequences of an additional Bay Cap reduction also deserve much greater weight. ASMFC’s own Committee on Economics and Social Sciences describes the reduction fishery as a critical and central sector of the economy around Reedville and cautions that the effects of reducing production are not necessarily proportional. Because this is a capital-intensive industry with high fixed costs, there are production thresholds below which employment can change dramatically; the Committee specifically notes that if landings fall below the volume needed to cover those fixed costs, the result could be not a partial layoff, but potentially a 100% shutdown of the facility. The Draft Addendum likewise recognizes that the Atlantic reduction fishery has already contracted from as many as 25 processing plants and 147 vessels historically to roughly 10 vessels and one remaining Atlantic processing plant in Virginia. Once that infrastructure and those skilled jobs disappear, they cannot simply be recreated. The consequences would extend well beyond one company to fishermen, plant employees, contractors, truckers, suppliers, local businesses, tax bases, and generations of families throughout Reedville and the Northern Neck.

Finally, the Reedville fishery produces something of real national value: a domestic, renewable and independently certified sustainable source of fish meal and fish oil. The U.S. Atlantic menhaden purse-seine fishery is currently MSC-certified through 2031, and NOAA identifies menhaden as the largest source of U.S. fish meal and fish oil production. These ingredients provide high-quality protein, essential amino acids and EPA/DHA omega-3s to aquaculture feeds, helping produce nutritious seafood for people. NOAA notes that aquaculture is highly efficient at converting feed into edible protein, and FAO has similarly found that farmed fish generally convert feed to protein more efficiently than most terrestrial livestock—an increasingly important advantage as the world faces growing demand for food along with constraints on arable land, freshwater and agricultural inputs. Fish meal and fish oil are also significant ingredients in American pet food: U.S. manufacturers used approximately 96,700 tons of fish meal and 6,350 tons of fish oil in 2024, and the Pet Food Institute specifically identifies menhaden fish meal among the marine ingredients used in pet foods. Losing the Reedville operation would eliminate a major source of domestically produced marine ingredients and increase reliance on imported or alternative supplies, affecting not only the Northern Neck economy but customers and consumers across the country. These products help feed people and animals efficiently and sustainably – and for millions of American families, pets are family too. I respectfully ask ASMFC to follow the science, maintain the current Bay Cap, and avoid imposing potentially irreversible economic consequences without clear evidence that an additional reduction will provide a measurable ecological benefit.

Please, please put the health of our environment first and vote for reductions in the commercial harvest of the Atlantic Menhaden. A healthy stock of Atlantic Menhaden is critical maintaining a healthy marine ecosystem up and down the Eastern Seaboard. Atlantic Menhaden are a critical lifeline to fish stock, wildlife, commercial industries, and so much more. Making sure that harvest levels are balanced is absolutely necessary to ensure that there is not domino effect on everything that is dependent on these fish. For the record, I am not anti commercial harvesting of menhaden. I'm in manufacturing and actually a good portion of our sales comes from supporting the commercial fishing industry. I also regularly take fish oil pills and depend on various lubrication products that keep my machines running smoothly. I'm not naive to the fact that menhaden oil is present in these products. My point is that the current harvest levels and practices are simply unsustainable and all sorts of disasters are inevitably going to follow if the biomass is depleted further. You have a tough job, and have to balance a lot of interests- but balance is exactly what is needed here. It is currently not so.
Thanks
Taylor

Comment

To the Atlantic States Marine Fisheries Commission and Members of the Atlantic Menhaden Management Board:

I am a Pennsylvania resident, conservationist, and avid bird watcher, and I am writing as an individual citizen who cares deeply about the health of the Chesapeake Bay and Atlantic Coast.

I grew up near the Chesapeake Bay in Maryland, and the Bay has been an important part of my life for as long as I can remember. I continue to spend time throughout the Chesapeake region and regularly visit the Atlantic Coast, including the Delaware beaches and New Jersey Shore. As someone who spends a great deal of time observing birds and wildlife in these ecosystems, I have a personal stake in ensuring that the forage base supporting these species remains healthy and abundant.

I strongly support reducing the Chesapeake Bay reduction fishery cap by up to 50% and establishing a dynamic Bay cap tied to a fixed percentage of the coastwide Total Allowable Catch (TAC), such as 13.6%. I urge the Management Board to adopt these protections rather than treating the Chesapeake Bay as a separate reservoir of menhaden available for intensive harvest.

The Bay cap should be directly connected to coastwide management. If the coastwide TAC changes, the Bay cap should change proportionally. A dynamic cap tied to a fixed percentage of the coastwide TAC would prevent the Chesapeake from experiencing a disproportionate increase in harvest pressure simply because coastwide quotas have changed. The Bay is not an isolated fishery; it is a critical component of a larger coastal ecosystem. Its management should reflect that reality.

I also strongly support an option to reduce the Bay reduction cap by 50% and establish strict seasonal or split-period allocations. Harvest pressure should not be concentrated into a single season or short period when menhaden are particularly important to predators and the broader food web. Spreading harvest over defined periods—and reducing the overall amount available for reduction fishing—would provide greater protection against concentrated fishing mortality and help preserve menhaden when and where they are most ecologically valuable.

This is fundamentally an ecosystem issue. Menhaden are forage fish, and their value cannot be measured solely by the pounds available for reduction harvest. They are an essential food source for striped bass, ospreys, marine mammals, and numerous other predators. When management removes large quantities of a forage species from an ecosystem, the question cannot simply be whether the menhaden population as a whole can withstand that harvest. We must also ask whether enough menhaden remain available, in the right places and at the right times, to support the predators and ecological functions that depend upon them.

I therefore urge the Commission to apply conservative coastwide and Chesapeake Bay harvest limits and a sufficiently precautionary standard for achieving ecological reference points (ERPs). Management should prioritize maintaining a healthy forage base and give the ecosystem a meaningful margin of safety rather than managing toward the maximum harvest that models suggest may be sustainable under favorable conditions.

As a citizen who spends time in these ecosystems, I want to see healthy populations of striped bass, ospreys, seabirds, and other wildlife continue to thrive along the Chesapeake and Atlantic Coast. I believe that protecting the forage base that supports these species is a fundamental responsibility of fisheries management.

I respectfully but strongly urge the Management Board to:

• Adopt a Chesapeake Bay reduction cap reduction of up to 50%;
• Tie the Bay cap dynamically to a fixed percentage of the coastwide TAC, such as 13.6%;
• Establish strict seasonal or split-period allocations to prevent concentrated harvest pressure; and
• Use conservative harvest limits and precautionary ecological reference-point management that protects the forage needs of predators and the broader ecosystem.

The Chesapeake Bay is too important to manage with a narrow focus on harvest alone. Menhaden are a foundation of the coastal food web, and management decisions made today will affect the wildlife, fisheries, and ecosystems that depend on them for years to come.

Thank you for considering my comments. Please enter this letter into the official public record for Atlantic Menhaden Draft Addendum II.

Sincerely,

Jennifer Chapman
Philadelphia, Pennsylvania

I am writing concerning the plight of the NJ Osprey population in NJ.

Over the course of the last several years their numbers have declined dramatically, because the young are staring in their nests for lack of food, specifically the menhaden fish.

I urge you to ban purse seine fishing to help alleviate the lack of fish available to them. I also urge you to limit harvest on the Chesapeake bay, which is the most important nursery for menhaden.

Thank you for your consideration in this matter.

While I support a complete ban on the industrial reduction of Atlantic Menhaden within the 3-mile limit of the entire Atlantic coast, reducing the cap by 50% in the Chesapeake Bay is at least a step in the right direction.

Our fisheries and marine ecosystems are under constant and growing assault by pollution, ocean acidification, and anthropogenic climate change-induced ocean warming. I implore the ASMFC to take any and all possible action to restrict the commercial reduction of atlantic menhaden and protect our fisheries for now and generations to come.

This is a resubmission of my comment as the previous message noted my state as Massachusetts when it should have been Maryland. Thank you.

As brought to my attention by a Maryland non-profit organization with interest in the Chesapeake Bay, I concur with advocating for the following in Addendum II:

- 3.1 Bay Cap: Option C1E and C2A
- 3.2 Bay Cap Distribution: Option B2 (Even Length/Uneven Harvest) and Option B for Quota Period Overages/Underages
- 3.3 Bay Cap Revisit Provision: Option B (To revisit the Cap every three years)

Several years ago, I authored a paper as part of my graduate studies about Russia being forced to change its fisheries strategy from being "far-distant" to "near-distant." It's predecessor, the Soviet Union, possessed one of the world's most formidable distant-water fishing fleets. The fleets harvested vast quantities of marine protein from the North Atlantic to the Southern Ocean, oftentimes depleting one fishing zone and then moving on to another. However, the rapid global adoption of

Exclusive Economic Zones by many nations, compounded by the economic collapse of the USSR, forced the Russian fishing industry to pivot from a far-distant fishery to a near-distant operation focused heavily within its own domestic waters.

My paper dealt primarily with the Russian Far East: The Sea of Okhotsk and the Western Bering Sea which became the bedrock of their industry. Russia, heavily dependent on the ocean for profits as well as feeding its population and livestock sectors, was still dependent on a high-protein source. It focused its efforts on high-volume, cold-water species like Alaska pollock and herring. Unfortunately, their penchant for overfishing indiscriminately continued, whereby juvenile stocks were harvested along with adults, leading to future stocks being depleted by a reduction of adults to repopulate. Moreover, pollock do not comprehend international maritime boundary lines very well, and thus fish that crossed over into Russian waters from the US side oftentimes failed to return, thus causing economic harm to US fisheries.

While I no longer follow such issues since my retirement, reviewing the paper by the Atlantic States Marine Fisheries Commission on the declining menhaden's declining population in the Chesapeake Bay allowed me to reassess the importance of controlled fishing policies. And thus, I submit my comments to help in looking for better and stronger solutions and enforcement for this important fish stock. Thank you.

There was a time in the not too distant past where I would leave Barnegat Inlet and be greeted by acres of bunker pods all up the coast toward Manasquan and beyond. Most, if not all, day markers in Barnegat Bay are nesting sites for Ospreys. But in recent years more and more nesting sites are vacant. Likewise bunker pods are becoming more and more difficult to find. I live in Barnegat Light and I found several dead young Ospreys in the marshes and on the beaches that look like they starved to death. Please follow the science and put reasonable regulations in place that protect this important resource. Time is of the essence. Thanks for the opportunity to contribute.

We need to take action to save the bay, a resource that many rely on for food. It shouldn't be able to be destroyed by foreign companies for short term profits. The locals need to take back what is ours, and we intend to do just that. We will continue to fight for what is right and I think the people we have elected should too.

I support the CT Audubon's request to reduce the Menhaden Fishery cap by 50% in an effort to protect osprey and their potential offspring. I have the privilege of living with osprey nests in my front yard. They are an important part of our eco-system. Their depletion would be a serious blow to the shore bird population.

Sounds like the current rules are creating an imbalance in nature. There should be a way to preserve jobs without causing harm to our ecosystem. Short term financial gains aren't worth the long term devastation that we'll create by being poor stewards of our natural resources.

I support a broad reduction in the Atlantic menhaden harvest off the coast of New Jersey and the Atlantic Coast in general. The recent crash in recruitment of Ospreys due to starvation is the Canary in the Coal Mine. The issue should be viewed in the context of long term economic viability of All commerce associated with this resource, not just one narrow sector. The economic value of commercial and recreational fishing of species dependent on Menhaden, as well as the burgeoning eco-tourism industry related to marine mammal and avian species far outweighs the limited benefit of a small sector of the economy. Seems like a straight forward choice to me.

I strongly support a significant reduction of the allowable catch of Atlantic Menhaden to a level of 50% of current allowed limits. Why? The menhaden population is a critical component of the Chesapeake Bay ecosystem, some have called it a keystone species. It is also an important component for the economics of multiple CB industries including seafood harvesting such as Striped Bass, and recreational activities such as fishing and bird watching. My belief is that there is not a single factor that affects menhaden populations in the Chesapeake Bay and that the commercial catch is just one of those factors. Environmental factors most likely play the greatest role in population fluctuations, but until we are able to control the environmental factors we must have a capability to adjust and modify those factors that we can control. There are a number of studies that indicate that the Chesapeake Bay menhaden population might be affecting other important species of the ecosystem. Please consider this allowable catch reduction before it might be too late for some species such as the Osprey that are currently in decline. Thank you for your serious consideration of this important matter.

I am a retired environmental educator and am very concerned about the impact of the industrial menhaden harvest on the Chesapeake Bay ecosystem. As an avid birder I am especially concerned about the impact to osprey in the bay. I urge you to reduce the Total Allowable Catch of Atlantic menhaden to no more than 100,000 metric tons for the next three years.

I have personally witnessed the effects of menhaden fishing in the chesapeak bay on downstream (or rather, "up gulf stream?") ecosystems. Birds, marine life, and shoreline economies including tourism proliferated after the Covid-19 pandemic temporarily shut down commercial Menhaden fishing in the Chesapeak Bay; the impacts of that decreased take were immediate, profound, and even experienced all the way up in New England. After the pandemic regulations were lifed, the Menhaden populations crashed up north, and were once again profound and immediate but completely negative. Birds like osprey were starving, and nesting success plummeted. So too did recreational fishing, commercial fishing of other species, and tourism. It was amaxing to witness how quickly and broadly all these effects occurred, just by changing volume of Menhaden being fished in the Chesapeak Bay. Significantly decreasing the volume of Menhaden allowed to be fished will have profound positive economic and ecological impacts.

Menhaden are are one of the most important fish on the Atlantic Coast. They are vital not just as a food source to the birds and fish that call the coast home, but also as a key forage fish species that many of our bait fisheries, coastal communities, and small businesses rely on. The Osprey population has struggled in recent years, and it has become clear that a healthy menhaden population is critical to the health of the entire Chesapeake Bay ecosystem.

As a concerned stakeholder, I want to thank you for the opportunity to comment on Draft Addendum II. I support the following management options:

3.1: Options C1e and C2a. I support a precautionary reduction in the Bay Cap by 50% of the current 51,000 metric tons for the reduction fishery. This will help increase the number of menhaden available in the Chesapeake Bay, an important nursery for Atlantic menhaden.

3.2: Option B2. I support the establishment of three quota periods for the Bay Cap at a 25/25/50% harvest distribution percentage per quota period. This will help reduce food competition for birds like osprey during the most vulnerable times of their life cycles.

3.3: Option B. I support reviewing the Chesapeake Bay Cap every 3 years. This gives the Commission the ability to plan and react to changing conditions and new information.

These options best support the Chesapeake Bay and ensure the health of our birds, peoplE, and planet.

We live along the coast in CT and have observed the drastic reduction in the number of Osprey, gulls and other sea birds along our shoreline. Please pass the legislation to reduce the volume and timing of menhaden catch to give the menhaden time to rebound thus helping to save these important birds.

Omega and their politicians in Richmond have been blocking meaningful studies regarding the health of all the Bay's species for decades.
Now Omega is asking us to allow them two more years to overfish the menhaden species.
Meanwhile, many of the species that allow on menhaden as their main food source are undernourished.
Fishermen have a long history of overfishing the animals that provide their livelihood.
Salmon, lobsters, cod to say a few in the US northeast and elsewhere have had to be restricted by regulation and have had varying degrees of recovery.
Ten years or so ago, Maryland and Virginia severely restrict Striped Bass fishing and that species has had a modest recovery.
The recovery of that fish would be stronger if there were more menhaden to eat.

Each summer I watch the ospreys roost at a neighbors next. They are a powerful marking of time for me. Children watch through binoculars at the fledging. We watch the male osprey bring food back to the nest. It is absolutely heartbreaking to think there is not enough food for the male to feed the hatchlings forcing the female to leave her chicks and then the chicks to starve and remain vulnerable to predators. This summer the screams of the chicks were particularly bad and in reading the horror of the amount of hatchlings surviving this year I am urging you to please, please curb the fishing so that these birds may continue to exist with us. We are not the only ones deserving of food. We can share. These are a keystone species. If they suffer who knows the invisible suffering taking place between the waters.

The strictest possible limits on menhaden need to be adopted. ASMFC needs to:

- Make the amount of Bay harvest responsive to coastwide management on the Atlantic.
- Make the timing of harvest more precautionary to protect menhaden predators.
- Make those timing limits actually mean something, by not allowing overharvest in certain periods.
- Make the entire system adaptable, with regular intervals to review how management is working.

The science is clear: ospreys are dying, and the foundation of the Bay's food chain needs relief.

1) I strongly recommend implementing a 50 % reduction in the Chesapeake Bay reduction fishery.
2) I have lived on the Magothy River in Maryland for 70 yrs and have in the past worked as a waterman commercially. I have been a life long advice angler.
3) I have witnessed the return of the osprey after banning DDT and now I am witnessing the demise of the osprey because they are not getting enough Menhaden to eat. This is tragic!
4) The concentration of intensive harvesting in the lower Chesapeake Bay for a reduction fishery is unacceptable. Especially without any scientific understanding of the consequences.
5) I urge managers to implement strict quota periods that distribute the harvest evenly across the year, instead of an intense summer harvest.

In past years there were many visible schools of Menhaden to be found in waters off NJ. This year I noticed none. Yet you tell us the Striped Bass catch needs to be smaller and I read Ospreys are in decline along the coast due to starvation. Perhaps you need to restrict the Menhaden harvest which both species are known to feed on.

I support the 50% reduction in cap of menhaden catch. I have lived in the Chesapeake Bay area all of my 60 year life. I have seen the recovery of the bay since the 1970's. I see the current catch of menhaden unsustainable and reversing the huge progress that has been made in health of the bay ecosystem. That recovery is both measurable and visible. The menhaden is critical to the health of many keystone species such as Rockfish and Osprey. Please reduce the catch limit! Too many jobs depend on a healthy bay ecosystem and we don't want to go backwards to an unhealthy ecosystem.

The Menhaden rules in Virginia are very political with nothing to do with science of the health of the Bay. To begin with, Virginia is the only state from Maine to Texas that allows Menhaden harvesting in their state waters. Why? Politics. You guys are using data from offshore which has nothing to do with the data that might be available if a true test of the Menhaden population in the Chesapeake Bay were used as it should be.

Bills in the Virginia Legislature have been introduced for the past 3 or 4 years that would fund a study done by the Virginia Institute of Marine Science (VIMS), the College of William and Mary, and many other stakeholders in the Bay region as well as Omega Protein. The funding has been refused by then Governor Younkin because he is good friends with Rob Wittman whose District includes Reedville, Virginia where Omega Protein operates. They are the primary harvester of Menhaden in the Bay.

Wittman makes one call to Younkin, and the funding is off the table. The only people fighting this study is a Canadian based company, Omega Protein. Everyone else, the retail bait and gear shops, the charter boat fishermen, the recreational fishermen, and everyone else that has any interest in fishing in the Bay is solidly against the take from the Bay of what has been called the most important fish in the Bay.

15 or 20 years ago, we caught 10-to-15-pound rockfish and blue fish in the Bay on a regular basis. Today they are practically nonexistent. The reason is simple. Their primary food source, menhaden, is so scarce.

Now let's talk about the Ospreys. The last 3 years have been the worst year on record since DDT for chicks to survive. Same reason. Omega Protein! The Osprey's primary diet (about 80%) in Virginia's lower Bay is Menhaden. As they go, so go the Ospreys.

The only real way to save the Bay, the Ospreys, rockfish and bluefish is a total ban on menhaden harvesting in Virginia waters like all of the rest of the states boarding the east and gulf coasts. The professional crabbers will survive since there are enough small-time menhaden harvesters to supply them with the bait they need to support their industry.

Your committee has the opportunity to do the right thing, but based on your past year's history, you guys don't have the guts to do help us save the Bay, the wildlife, the fishermen and bird lovers in Virginia. Part of the problem is our fault by allowing Omega Protein in our waters. We need to fix that for sure. Hoping your committee with do your part in this fight.

ASMFC,

Menhaden is shared resource, and should be shared by all.

What happens in the Chesapeake Bay affects the entire coast. The Bay is the largest estuary on the Atlantic coast, and many fish begin their lives there, especially the striped bass.

I want to go on record that I support addendum 2 and support option B4, with a 50 percent reduction to 25,500 metric tons.
Please do not link the Bay Cap to the Coastwide TAC.
I oppose option C,
I support option B1, and
I support option B, revisiting the cap every three years.

Thank you for your time,

Robert McDowell

Writing to you with the hope we can find a balance between protecting our natural wildlife systems and allowing our fisherman tomake a living.
We need to look at overfishing as a serious issue.
My hope is you will consider the consequences of the loss of our seabirds like osprey.
All our birds of prey are under stress due to in part lack of food.
Once these things get critical there is no coming back.

Menhaden, a small, nutrient-dense fish, is the key prey species for Ospreys feeding their chicks. However, menhaden populations are shrinking, which scientists believe is contributing to Osprey nest failures. It is your moral imperative to ensure that the menhaden are readily available for Ospreys who are fishing to feed their young. Please cut the harvesting of menhaden by at least 50% so that we do not lose these precious birds to starvation. Thank you!

I spoke at the last public comment but I want to reiterate my vote.

I SUPPORT:
3.1.....50% cut in Bay Cap. There should be NO fishing in the Bay.....PERIOD!
3.2...Even seasons
No pay back's....If you dont catch your quota, too bad.....leave the fish in the Bay
3.3...Revist every 3 years or sooner.

I have lived through this before, Long Island Sound back in the '70's-'80's.....purse sein boats came in and wiped out the bunker population in LIS for many years. All fisheries just tanked.

I have been a charter Capt. up and down the East Coast and have seen the decline in the menhaden population first hand. If you kick out the legs of the chair you are sitting on.....what happens? The chair falls, menhaden are the "legs" of the waters. You take out all the farmers.....what happens? We have no food and people die off. I now live on the Bay and work on the Bay.....we used to have acres of menhaden in the Bay and in the Potomac, now.....none!

Rockfish, Reds, Blues.....Ospreys, dolphin.....everything DEPENDS on the menhaden population. Why is this so hard for you all to grasp.

This is a Canadian company that is taking OUR resource for their own selfish profit. What goes on in the Bay effects the ENTIRE East Coast, how many people is that?

I was in the Law Enforcement arm of VMRC.....I used to check theses ships in port. What they do is criminal, the amount of fish they take is just absurd. When Omega went over their Bay cap a few years back.....they just thumbed their nose at the world and said....so what. Nothing was done to them.

There should be NO fishing in the Bay or in any part of VA state waters. All the other states ban this practice. How can Virginia be "right" to say sure.....fish in our state waters, when NO other sate on the East Coast allows this fishing in their waters. Oh.....except Louisiana....oh thats right, thats where Omegas other fleet operates. How coincidental!

Lobbyist money goes a LONG way. Richmond needs to stop this practice once and for all. BIG money certainly steers this ship for Omega. Just check and see how much money goes to Richmond politicians.

I could go on.....do the right thing and stop this practice.

Capt. Jeff Stonehill
King George, VA.

Connecticut's Ospreys are sending a warning.

CT Audubon's Osprey Nation program ended its 2026 season with its worst breeding success ever.

With 99% of the season's data compiled, Osprey productivity stands at just 0.87 chicks per breeding pair, down sharply from the previous record low of 1.26 in 2025.

For the first time in Osprey Nation's 13-year history, the majority of successful nests produced only one fledgling rather than two — a troubling sign that food shortages may be playing a major role.

"This is an unmistakable warning sign," said Conservation Science Manager Matt Joyce. "This is probably the strongest evidence we have that there is an issue with prey provisioning."

That's why Connecticut Audubon is making one final push to protect Atlantic menhaden, an important food source for Ospreys.

We are urging the Atlantic States Marine Fisheries Commission to reduce the Chesapeake Bay menhaden fishery cap by 50% as a precautionary step to help ensure enough fish remain for Ospreys and other wildlife.

I am in strong favor of reducing the harvest of Menhaden in both the Chesapeake Bay and Coastal Waters by at least 50% and reducing the seasonal quota.
In fact, I am in favor of a total moratorium of the commercial harvesting of this fish for at several years in an attempt to preserve the species.

I live on the water, off the Severn River. Over the past several years, we have noticed a major decline in the ospreys, cormorants, and other predator species (all relying on Menhaden as food). I have noticed an increase in seasonal sitings of dolphins, as high north as the Bohemian River (looking for food). We have seen, first hand, the Osprey nest declines along Greenbury Point, and Mill Creek. This has been a dramatic change.

The over commercial harvesting has greatly created a decline in a major food-chain fish, the menhaden. These commercial companies need to be greatly limited in how much, and how, they harvest both in the Chesapeake and along the Coastal waters. Spotter planes, used to locate the schools of fish, should be outlawed!

Protect the Menhaden before it is too late!

Thank you for your consideration.

It is evident why all other states have limited menhaden fishing to a much more stringent degree than Virginia. It's abundantly clear that the Osprey population is critically impacted by the declining menhaden levels, and the additional ecological impacts, many of which are likely unseen as of now, will surely add up. The state of Virginia needs to recognize the overfishing and course correct by imposing safe limits akin to those in other central Atlantic states. Save our waters and save the ospreys.

We need to STOP over fishing the Menhaden. Ospreys nests are in trouble. No food for the babies. Our striped bass are in trouble again foraging for food against the Blue catfish Omega protein regularly overfished their quota and their quota is too large to begin with. My suggestion would be to allow them to Only fish the ocean. Give the Osprey a chance.
I used to get baby strippers in my minnow traps. Haven't seen them in quite a few years

Please adopt a 50% quota cut on commercial menhaden harvest in the Chesapeake Bay.
As an Osprey steward for the Connecticut Audubon Society I am alarmed by the sudden and grave decrease in Osprey and nestlings that we have been monitoring.
I am horrified to know that the population decrease I am witnessing is due to starvation as a result of overfishing of menhaden in Chesapeake Bay. But, I am optimistic that Osprey can be saved by limiting the quota of menhaden harvest.

Comment

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):
I am writing as a Maryland resident who has lived in St. Mary's County since 2001 and has developed a deep personal connection to the Chesapeake Bay. I am an avid conservationist, angler, birder, and someone who spends considerable time on and around the Bay. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base.
I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.
The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - menhaden.
Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. Where and when the fish are removed matters.

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.

I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.

For that reason, I urge the Commission to establish strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months. Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coastwide fishery.

There is also an important management issue that deserves attention. The Commission's coastwide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.

I respectfully urge the Commission to:

1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.
2. Establish firm seasonal quota periods for menhaden.
3. **Prevent excessive concentration of reduction harvest during the summer months.
4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.
5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.

I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting.

The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake Bay users and stewards.

Sincerely,

Amber Ewing
St. Mary’s County, Maryland

Beyond the early spring of this year, I have seen no schools of Bunker or Manhattan swimming along the coast. I have a beachfront house in Long Beach Island. And I am able to observe what goes on in the water on a daily basis. The lack of Manhattan schools is alarming and this has caused a severe reduction in the fledgling of osprey chicks. Therefore it is necessary to significantly reduce the commercial harvesting of Manhattan along the eastern seaboard, including New Jersey and the Chesapeake Bay to restore these schools of this very important fish.

I am a retired charter boat captain, and I have seen, firsthand, the reduced population of two very popular fish species, namely Striped bass and Bluefish.

Please consider severely reducing the amount of menhaden that are currently being caught in the Virginia portion of the Chesapeake Bay.

Responsible management of the menhaden fishery in Virginia is long overdue. It's time to restore this keystone species before it's too late.

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):
I, and as many of my friends as I can muster, strongly support reducing the Chesapeake Bay reduction-fishery cap by 50 percent—from 51,000 metric tons to 25,500 metric tons per year—and establishing strict seasonal quota periods for menhaden. The Chesapeake Bay is too important, and the ecological warning signs are too serious, to continue managing this critical forage fish as though the timing and location of harvest do not matter.

We have lived in District of Columbia and St. Mary's County since for well over 30 years and have developed a deep personal connection to the Chesapeake Bay and the Potomac River and the associated watersheds. We spend considerable time on and around the Bay. We live on the water in the Potomac watershed and have seen the decimation of the Osprey population and its impact on the overall ecosystem. We care deeply about the wildlife that depends upon it, particularly osprey, striped bass, and other species whose survival is tied to a healthy and abundant forage base.

We are seeing warning signs that should demand a precautionary response. Declining productivity, widespread osprey nest failures, and continuing concerns regarding the Chesapeake Bay striped bass population are not isolated issues. They are reasons to examine carefully whether we are removing too much forage from the Bay at the wrong time.

Menhaden are a foundational forage species. They feed an extraordinary range of predators, including striped bass and osprey. Yet the reduction fishery can remove more than 100 million pounds of menhaden from Chesapeake Bay under the existing annual cap. When a substantial portion of that harvest is concentrated into an intense summer fishing window, the issue is not simply how many fish are removed annually. It is when and where those fish are removed.
A menhaden harvested from a concentrated school in the Bay during the summer is no longer available to the predators that depend upon that school. Concentrated removal can create localized depletion during a biologically important period and can affect the availability of forage to other users of this shared public resource.
The consequences extend beyond the reduction fishery. Menhaden support the Bay's recreational fishing economy, commercial and charter fishermen, watermen, wildlife, and coastal tourism. One user group (Canadian or otherwise) should not be permitted to concentrate an enormous harvest of a shared forage resource during the period when that resource is most important to the rest of the ecosystem and to other Bay users.

For that reason, I urge the Commission to take the following actions:
• Reduce the Chesapeake Bay reduction-fishery cap by 50 percent to 25,500 metric tons annually.
• Establish strict seasonal quota periods that distribute harvest throughout the year rather than permitting an intense summer harvest.
• Apply a precautionary management approach in light of uncertainty regarding localized menhaden abundance and the ecological condition of the Chesapeake Bay.
• Give greater consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the broader Chesapeake Bay economy.
The Chesapeake Bay is not simply a location on a fisheries-management map. It is a complex and interconnected ecosystem, and menhaden are one of its essential links.
We can not wait for further deterioration before taking action. A later solution will come at extreme cost.
As someone who lives here, sails these waters, dives in them, and cares deeply about the wildlife that depends upon them, I believe the Commission has an obligation to manage menhaden conservatively and to recognize that the health of the Bay must take precedence over maximizing a concentrated industrial harvest.
Reduce the cap. Establish meaningful seasonal quotas. Protect the forage base. Give the Chesapeake Bay—and the people and wildlife that depend upon it—a greater margin for recovery.
Living here I would like to be remembered for sustaining what has made the Chesapeake “the land of pleasant living. Not decimating it for myopic corporate greed. Thank you for considering my comments.

Sincerely,
Brian L. Williams
District of Columbia and St. Mary’s County, Maryland

Menhaden are the "Keystone" prey fish species in our coastal and bay waters.
Menhaden are also filter feeders and clean vast amounts of water...averaging 4 gallons per minute. That is how they eat, filtering tiny phytoplankton, algae, and zooplankton from the water.
This is something that needs to be done.

I strongly support the most protective alternatives in Draft Addendum II, including the maximum 50 percent reduction in the Chesapeake Bay reduction-fishery cap. I believe these protections are necessary now, but should be viewed as an interim step toward removing industrial reduction fishing from Virginia state waters.
I have a direct and longstanding interest in this issue. I am a Maryland property owner and also own Bay-adjacent property in Northampton County, Virginia. I am the Editor and a founder of Menhaden Little Fish - Big Deal!, a member of SMRFO and the Virginia Saltwater Sportfishing Association (VSSA), a recreational angler, and a conservation advocate.
The central scientific question is not whether Atlantic menhaden are healthy coastwide. It is whether there are enough menhaden within Chesapeake Bay, in the right places and at the right times, to meet the needs of predators and the broader ecosystem while a concentrated industrial reduction fishery operates there. ASMFC itself has acknowledged that the coastwide stock assessment cannot answer that Chesapeake-specific question.
Recent osprey research documenting food stress and poor reproductive performance, unresolved questions about localized depletion and concentrated fishing near the Bay entrance, and the continuing lack of adequate Bay-specific abundance and movement data all argue for precaution. These studies do not prove that the reduction fishery alone is responsible for the ecological problems being observed. But the absence of conclusive proof of harm should not be treated as proof that harm is not occurring.

Economic considerations should also extend beyond the reduction fishery. Menhaden left in the water support predator fisheries, recreational and commercial fishing, wildlife, tourism, and other ecosystem values. The January 9, 2024 Northampton County Board of Supervisors resolution demonstrates that concerns about industrial menhaden fishing are also shared by a Virginia locality directly affected by this fishery.

My concern is personal as well. I have seen the effects associated with this fishery along the Chesapeake shoreline, including images of fish kills that have stayed with me, while birds I have loved watching have diminished or disappeared from familiar places. Those observations are not substitutes for scientific evidence, but they explain why the unresolved scientific questions matter so much to me.

When I fish with children, I teach them that conservation means taking responsibility for what we remove from the water and leaving enough behind for the ecosystem and for those who come after us. I believe our fisheries-management institutions should follow the same principle.

Please adopt the strongest protections available under Draft Addendum II, continue and accelerate Chesapeake-specific science, and begin developing a long-term framework to move the industrial reduction fishery out of Virginia state waters.

I am writing to strongly support the adoption of the following options under Draft Addendum II. These measures will reduce the Chesapeake Bay's menhaden harvest, time the harvest more sensitively, build a smarter management system, protect menhaden especially at critical points of their life cycle, keep Bay harvest limits tied to coastwide management, and ensure that management can adapt as new science becomes available.

Specifically,
3.1 Chesapeake Bay Reduction Fishery Cap Amount: - I support option C1e, which would reduce the Bay Cap by 50 percent and limit it to 13.6 percent of the Coastwide Catch Limit (TAC). I also support option C2a, which sets an upper limit of 51,000mt for the Bay Cap — which is the current level.

3.2 Chesapeake Bay Cap Distribution: I support option B2, which establishes three equal-length quota periods for the Bay Cap, but distributes harvest as follows: 25 percent in period 1, 25 percent in period 2, and 50 percent into period 3. I also support option B, which establishes quota-period overage payback and rollover of unused quota within a fishing year.

3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision: I support option B Revisit Provision, which would reassess the

efficacy of these new management tools every 3 years.

I write this as a birder, volunteer naturalist and nearly lifelong Maryland resident, who, growing up on the Bay, has known about menhaden since childhood. I have witnessed the resurgence of Osprey in the Chesapeake Bay -- the nation's leading nesting population -- and the recent devastating decline in nesting success due to nestling starvation. Let's do the one thing that we know will help Ospreys by adopting the options specified above in Draft Addendum II to better manage the tonnage and timing of menhaden harvests in the Chesapeake Bay. Thank you.

I recommend that the current cap take into account that Virginia has approved a study of the impact of the menhaden fishery on rockfish and osprey populations. If that study benefits from either the status quo or a reduction of the cap, I would support that.

In addition to Chesapeake Bay, the Delaware Bay and Barnegat Bay (NJ) areas are being affected by the Menhaden shortage. We have had dramatic decreases in Osprey fecundity due to starvation of the chicks, and our striped bass fishery is dramatically being affected by the paucity of Menhaden.

We must act swiftly to limit the commercial catch in Virginia of menhaden. As a former CT legislator, board proxy and active saltwater sportsmen I can attest to the growing concern over a telltale sign in the CT River Valley—-abysmal Osprey nesting success. I fought in 2015 to install an Osprey platform on the East Haddam Swingbridge and have marveled at the growing nesting pairs along our river and Long Island Sound. This year was heartbreaking to watch failure and yet failure.

Please re-examine the catch size and I fully support the most aggressive reductions possible. We must do more to acknowledge the importance of this critical species to our ecosystem.

Best Regards,
Melissa Ziobron

I'm concerned with the lack of data on menhaden population and the status showing they are not being "over fished". Evidence of a declining osprey population points to issues with overfishing.

Draft Addendum II addresses actions to be taken now that will allow for the rebuilding of the menhaden numbers and benefiting the Chesapeake community at large. Failure to do so will shorten the future of the menhaden industry along with a dire impact on our bay.

Thank you for your support of The Chesapeake Bay ecosystem.

Please put a 50% or more cap on menhaden fishing. Make Omega move further out into the ocean. Put fishing and birds, particularly Ospreys first. It's hard to understand how The Tyson Foods poultry processing plant in hanover va closure in May 2023 eliminating 692 jobs wasn't a big deal to the State, but the Omega processing plant with less than half the number of employees is carrying so much political weight unless the State is being paid off. The science has always been there. Lets be honest.

I strongly support reducing the Menhaden fishery cap by a full 50%.

As concerned citizen and lifelong resident of the Lynnhaven River watershed, I feel a strong connection to the waters upon which both people and wildlife depend. The Chesapeake Bay and the broader Atlantic ecosystem are extraordinary resources, but they are also fragile and must be managed responsibly.

Modern fishing techniques, including the use of spotter aircraft and purse seines, have made it possible to harvest Menhaden with extraordinary efficiency. While these methods support a commercial fishery, that efficiency also means we must be particularly careful not to remove so much Menhaden from the ecosystem that insufficient numbers remain for the many species that depend upon them.

Menhaden are a critical part of the marine food web. They provide an important food source for Osprey, striped bass, bluefish, dolphins, whales, and numerous other species. Protecting adequate Menhaden populations is therefore not simply about protecting one fishery, it is about protecting the broader ecosystem and the communities, recreational opportunities, and commercial fisheries that depend upon it.

A 50% reduction in the harvest cap would be an important step toward ensuring that Menhaden remain abundant enough to support both a sustainable fishery and the wildlife that depend upon them. Responsible management today will help ensure that fishermen, boaters, anglers, and future generations can continue to benefit from the bounty of the Chesapeake Bay and Atlantic coast for years to come.

I am particularly concerned about the health of Osprey populations and the challenges facing Osprey fledglings. We have an obligation to do a better job of sharing these waters with the wildlife that depend upon them. Maintaining a healthy and abundant Menhaden population is an important part of that responsibility.

I respectfully ask that you take action to protect Menhaden, Osprey, and the many other species that rely upon this vital food source by reducing the Menhaden harvest cap by 50%.

Thank you for your attention to this critically important matter and for your efforts to protect the Chesapeake Bay, the Atlantic ecosystem, and the communities that depend upon them. I would welcome the opportunity to support additional efforts to protect this vital resource.

With hope,

Julia Mallalieu

Hello,
My name is Caroline Ianniello and I am a fisheries scientist with a PhD from Boston University. I am in favor of the following actions:

-Reducing the initial Chesapeake Bay Cap by 50%, from 51,000 to 25,500 metric tons.
-Establishing the Bay Cap at 13.6% of the coastwide total allowable catch so it can adjust when the coastwide quota changes.
-Maintaining 51,000 metric tons as the maximum Bay Cap, with no fixed lower limit.
-Allocating 25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period.
-Requiring early-season quota-period overages to be deducted from the corresponding period during the following year.
-Requiring ASMFC to revisit the Chesapeake Bay Cap and related management measures every three years.

I have done extensive research on the interaction between menhaden and water quality variables (see https://academic.oup.com/icesjms/article/83/7/fsag117/8725438), and recognize that this valuable resource is under pressure not only from the commercial industry, but also water quality habitats such as decreased oxygen and variable chlorophyll

levels that will cause it physiological stress. Please take strong actions to ensure that this fishery lasts into the future, as well as the fisheries that it supports.

Thank you,
Caroline Ianniello, PhD

I strongly endorse the reduction in the Menhaden fishery cap to a full 50% reduction.

As a USCG licensed mariner and environmentalist, I am deeply connected to the waters which we humans, along with most all other species rely upon to sustain life. Modern fishing techniques such as the use of spotter planes and purse seines make collection by humas simply too efficient, leaving little for the rest of our wildlife who depend upon the Menhaden as a vital resource, just as we do.
Modern fishing techniques, including the use of spotter aircraft and purse seines, have made it possible to harvest Menhaden with extraordinary efficiency. While these methods support a commercial fishery, that efficiency also means we must be particularly careful not to remove so much Menhaden from the ecosystem that insufficient numbers remain for the many species that depend upon them.

I am writing to express my concern over declining rates of osprey fledging along the Jersey Shore this year. According to the Conserve Wildlife Foundation of NJ and Stockton University biologists, this was the worst breeding season for osprey in 30 years. In 2023 there were 800 nests in NJ , now in 2026 there are only slightly more than 500 with activity. 57% of those failed to produce any young. Those that did, saw many fledglings starve and die. Something needs to be done to stabilize the population of this great predator.

My family enjoys watching the osprey fish off the Ocean Grove beaches, using the pier as a vantage point before their dramatic plunge! We look forward to their annual return, seeing the nest platforms built by the Belmar Rte 35 bridge, the Bradley Beach gas station, Asbury Park High School and Loch Arbor areas get occupied by nesting pairs. We can hear their distinctive from our back porch as they head home or to the oven.
NJ took these birds off their Endangered Species list in 2025. Something has changed.

Atlantic Menhaden are their primary food source. I am asking you to rein in the menhaden catch limits to bring these magnificent birds back and stabilize the ecosystem before it is too late. The Neptune NJ Public Library is having a program on Osprey on January 23rd to make the public aware of their decline and to encourage citizen science. Ben Wurst will be the

speaker. We will not sit by and see a bird that came back from the brink once, disappear without a fight. Please help the osprey by limiting the menhaden catch now!

Atlantic Menhaden are their primary food source. Something must be done to limit

I'm a Maryland resident and recreational angler who fishes the Chesapeake Bay out of Solomons Island for rockfish and bluefish. I urge the Board to adopt the strongest options in Draft Addendum II: a 50% reduction to the Chesapeake Bay Reduction Fishery Cap, a Bay Cap linked to the coastwide TAC, and three quota periods so harvest can't concentrate in the spring and summer.

The Bay is the most important nursery on the coast for menhaden and for the predators that depend on them. Striped bass have had years of poor spawning success, ospreys in parts of the lower Bay are struggling to raise chicks, and the Board itself started this addendum because of concerns about impacts on the Bay's bait fisheries. Menhaden are the foundation all of that rests on. Allowing up to 51,000 metric tons a year to be pulled out of the Bay by industrial purse seines works against everything Maryland and Virginia are doing to rebuild striped bass.

The Bay Cap hasn't changed since 2018, even though the Board cut the coastwide TAC by 20% for 2026. The Bay Cap is now a larger share of the coastwide limit than before, which is the wrong direction. Linking the cap to the TAC fixes that going forward, and a 50% cut corrects where we are today.

The Board's own Work Group could not determine whether there are enough menhaden in the Bay to meet predator demand. When the science can't answer that question, the precautionary choice is to leave more fish in the water, not to keep harvesting at the same level and wait for proof of harm.

A 50% reduction is the most this addendum allows, and I support it. I also urge the Board to begin work on moving reduction fishing out of the Chesapeake Bay entirely. The Bay is a nursery and should be managed like one.

Thank you for the opportunity to comment.

I support the CBF position on protection of menhaden and the bay and its inhabitants. Key points are:

Section 3.1 Bay Cap Amount: Options C1e (reduces the Bay Cap by 50% and then links it to the Coastwide catch limit at a 13.6% proportion) AND option C2a (Upper Cap limit of 51,000mt and no lower limit)

Section 3.2 Bay Cap Distribution: Options B2 (3 even length/uneven harvest quota periods 25%-25%-50%) AND Option B (establishes quota period overage and underage provisions)

Section 3.3 Bay Cap Revisit Provision: Option B (revisit the Bay Cap every 3 years)

Thank you

Subject: Public Comment: Protect Chesapeake Ospreys by Capping Menhaden Harvests
Dear Commissioners,
I am writing to express grave concern over the alarming decline of Chesapeake Bay Ospreys and to urge immediate action to reduce industrial menhaden harvests in the Bay.
Recent scientific studies show Osprey breeding success in the lower Bay has fallen to record lows, driven primarily by chick starvation. Menhaden are the foundational forage fish for our ecosystem, yet delivery rates to nests have dropped over 80% in key breeding grounds like Mobjack Bay.
While coastwide stock estimates look stable, industrial purse-seine fishing causes severe localized depletion during critical nesting months. Ospreys are the "canary in the coal mine" warning us that the food web is failing.
I urge the Commission to:
1. Significantly lower the Chesapeake Bay industrial harvest cap.
2. Establish seasonal closures in sensitive nursery areas from April through July.
Please act today to safeguard our forage fish and protect the Bay’s iconic wildlife.

Thank you a concerned citizen of the Chesapeake Bay Area. Please feel free to reach out to me @ 443-872-2846

Comment

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):

I am writing as a Maryland resident who has lived in St. Mary's County since 1990 and has developed a deep personal connection to the Chesapeake Bay. I am an avid nature lover, angler, kayaker, snorkeler and scuba diver, a conservationist, and someone who spends considerable time on and around the Bay. I have personally seen a sharp decline in the number of occupied Osprey nests visible from my house. Last year's occupancy was down to one of three occupied and this year none were occupied. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base.
I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.

The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - menhaden.

Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. Where and when the fish are removed matters.

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.
I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.
For that reason, I urge the Commission to establish strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months. Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coastwide fishery.
There is also an important management issue that deserves attention. The Commission's coastwide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.
I respectfully urge the Commission to:
1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.
2. Establish firm seasonal quota periods for menhaden.
3. **Prevent excessive concentration of reduction harvest during the summer months.
4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.
5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.
I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting. The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake Bay users and stewards.

Sincerely,
Alan Herod
St. Mary’s County, Maryland

With osprey populations crashing from starvation, please help support osprey as well as the fish populations that depend upon menhaden. Please decrease the levels of menhaden that can be harvested by fisherman. You have opportunity to turn this negative situation around. Menhaden is the primary food source of osprey chicks and the current menhaden population is no longer available in the quantities needed to support them. Menhaden are one of the most important fish on the Atlantic Coast to other species to fish as well.

As a concerned stakeholder, I want to thank you for the opportunity to comment on Draft Addendum II. I support the following management options:

3.1: Options C1e and C2a. I support a precautionary reduction in the Bay Cap by 50% of the current 51,000 metric tons for the reduction fishery. This will help increase the number of menhaden available in the Chesapeake Bay, an important nursery for Atlantic menhaden.

3.2: Option B2. I support the establishment of three quota periods for the Bay Cap at a 25/25/50% harvest distribution percentage per quota period. This will help reduce food competition for birds like osprey during the most vulnerable times of

their life cycles.

3.3: Option B. I support reviewing the Chesapeake Bay Cap every 3 years. This gives the Commission the ability to plan and react to changing conditions and new information.

These options best support the Chesapeake Bay and ensure the health of our birds, people, and planet.

Sincerely,

Chris Penniman
Old Lyme, CT

Hello my name is Stephen King; I have lived on the Northern Neck all my life and have fished the bay since I could walk. My boat is actually docked in Reedville, and I have family who work for Omega. Me and some of my family members have talked about the menhaden issues and the lack of fish, and I can tell you firsthand, they don't care, they are in it for the money and at the end of the season they are on unemployment and still get paid. PLEASE SAVE THE BAY AND VOTE FOR OPTION C1e reducing the bay cap 50%. If Omega can't live off making 1million dollars a year instead of 2million and we know this is just a throwing numbers out there, maybe VA needs to shut them down like other states did to save the bay and the small people who make a living.

I am very concerned about the overfishing of Menhaden in the bay. We need to protect our bay for the welfare of all the fishermen long-term, as well as the wildlife that lives here.

The following are the important points I believe should be included:

Section 3.1 - Option C1e - Reduce Bay Cap 50% and limit it to 13.6% of the total coast-wide catch. This seems like a fair solution to start the bay on the way to recovery and can be looked at again in 3 years (see below).
Section 3.2 - Option B2 - Chesapeake Bay Cap Distribution. This distributes the allowed harvest over the season as opposed to concentrating it during the most sensitive time for osprey reproduction.
Section 3.3 - Option B - Allows reassessment of management practices every 3 years. As the science progresses, these policies would get regularly reviewed.

Thank you.

RE: Atlantic Menhaden Draft Addendum II

Hello,

Please support options that cut the Bay cap by up to 50% and establish strict seasonal blocks for menhaden harvest. Caps should be tied dynamically to a fixed percentage (e.g., 13.6%) of the coastwide Total Allowable Catch (TAC), and fishing mortality spread out to protect juvenile nurseries during peak vulnerability. This keystone species is vital forage for osprey and striped bass; industrial harvest must NOT starve local predators and endanger the entire ecosytem.

I am a lifelong resident of the Chesapeake Bay watershed who is alarmed by the collapse of osprey populations, and I request that my comment be entered into the official record.

Thank you.

Growing up in Old Lyme, where I still reside, and spending summers on our island off the coast near Rocky Neck State Park, I have witnessed firsthand the incredible abundance of wildlife that once defined this area, particularly our osprey populations. In recent years, however, I have seen a devastating decline in menhaden, commonly known as bunker, which are a critical food source for ospreys and other marine wildlife.

As commercial fishing pressure has increased, the impact on our local ecosystem has become increasingly difficult to ignore. I have personally witnessed ospreys struggling to find food and, heartbreakingly, dying of starvation. An area that once supported thriving wildlife now feels like a shadow of what it used to be. These changes are not just numbers on a chart or statistics in a report; they are happening in the waters, marshes, and shorelines that I have called home my entire life.

We need stronger, science-based fishing regulations and meaningful protections for menhaden populations before the damage becomes irreversible. These fish are a fundamental link in our coastal food chain, and when they disappear, the consequences ripple throughout the entire ecosystem. Ospreys cannot survive without an adequate food supply, and neither can the countless other species that depend on these waters.

At what point do we recognize that our desire to harvest natural resources does not give us the right to destroy the ecosystems that sustain other living beings? We have a responsibility to be stewards of these waters, not simply to exploit them for short-term gain. Wildlife has an inherent value beyond its economic usefulness, and we have an obligation to protect the species with which we share this planet.

I fear that if we continue down this path without stronger safeguards and accountability, we will lose the very wildlife that makes this place so special. We cannot keep taking from nature without giving it the opportunity to recover. Protecting menhaden means protecting ospreys, our coastal ecosystem, and the future of the place we call home. We must act now, before what was once abundant becomes something our children and grandchildren only hear stories about.

3.1 Chesapeake Bay Reduction Fishery Cap Amount
Support option C1e: that reduces the CAP by at least 50 percent in 2027 and limits the future Bay Cap to 13.6% of the Coastwide Catch Limit (TAC).
Also, support option C2a, which sets an upper limit of 51,000mt for the Bay Cap (the current level).
3.2 Chesapeake Bay Cap Distribution
Support option B2, which establishes three even length quota periods for the Bay Cap, but distributes harvest 25% in period 1, 25% in period 2, and 50% into period 3.
Also, support, option B, which establishes quota period overage and underage provisions within a fishing year.
3.3 Chesapeake Bay Reduction Fishery Cap Revisit Provision
Support Option B to revisit the Bay Cap every 3 years.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Reducing the Chesapeake Bay cap is a commonsense, ecosystem-based management decision that prioritizes the long-term health of the Bay over concentrated commercial extraction. We need to look at the Science and not the money and political aspects.

Industrial harvesting from over-concentrating in this critical nursery habitat has to be mitigated.

I do NOT support lowering the cap on commercial menhaden harvests by commercial fishermen in the Chesapeake Bay. The current reduced menhaden population has created widespread nesting failure to the Chesapeake Bay Osprey population. Any further reduction in the menhaden harvest cap would severely harm the largest Osprey breeding population in the world. Due to the current conditions researches at the Center for Conservation Biology at William & Mary expect the Osprey population to decline by 50% in the next ten years. The Osprey population needs to recover before any cap reduction is considered. In fact, a moratorium should be implemented on commercial menhaden harvests for a set period.

As a resident of Virginia and a supporter of responsible conservation management of the Chesapeake Bay I DO NOT SUPPORT lowering the cap on the commercial menhaden harvests.

I understand this decision pits conservation of this ecosystem against people's jobs, but I still think it's necessary to curtail the fishing further. It is one of the few levers we can control to help preserve our Osprey population as well as the general health of the bay. If we prioritize unsustainable fishing jobs now, we will likely lose both the ecosystem AND the jobs in the long run.

Please institute the contemplated catch quota reduction immediately. Doing so is not an irreversible decision, but resource depletion beyond recovery is irreversible. Don't study the issue while the fish continue to be harvested; study it when they commence recovery. This debate has gone on long enough. Take strong action now.

As a concerned resident of Maryland, I fully support limiting the Menhaden catch by commercial boats by 50%. Our Bay and other Atlantic Coast estuaries will not thrive without this fish. Please think of the longer view instead of the bottom line of corporate entities who could seek alternative options like farming fish, or vegetarian alternatives.

I'm a Virginia Beach resident and long time recreational fisherman and boater. Regardless of what Omega Protein keeps telling your commission, the menhaden schools of the lower Chesapeake bay are nonexistent compared to 25 years ago. Omega took millions and continues to take millions. We're the only state on the east coast that allows the reduction fishery. Why is that? Currupt politics. No other explanation comes close to making sense. We have no striped bass fishery, where it was once the best in the world. Why? No bait, no menhaden.

Comment

Although OLSPS is not involved in the management of the menhaden fishery in the USA, we felt it would be relevant to note that a new fishing data collection technology, developed by OLSPS, is now used by the entire menhaden fishery. We believe that the steps the menhaden fishing industry has taken over the last few years have significantly improved data collection, quality, credibility and management in this fishery. By taking these steps, the industry has voluntarily addressed a key issue the Commission raised: "the Commission acknowledges that data are currently insufficient to comprehensively measure Bay-wide abundance or isolate the exact contribution of fishing pressure versus environmental conditions." As a result, the uncertainty caused by insufficient data has been considerably reduced. Given the major social and economic impact of introducing such drastic measures, perhaps less radical steps could be taken instead. Of course, the menhaden resource should still be monitored for trends, with stepwise action taken where the much-improved data collection process supports it.

I fully support reducing menhaden catches by 50% on the Chesapeake Bay and creating quota periods to distribute harvest under the cap more evenly throughout the fishing season. I live on Langford Creek off of the Chester River and have seen a frightening reduction in ospreys nesting on platforms on our creek. This past summer, all but one of the 10 or so platforms on our creek were empty and the nest on the one platform produced no chicks. This is a deeply troubling change from 15 years ago when most of these platforms were bustling with life, and has been one that has been particularly noticeable over the past 5 years. No industry or business should be allowed to wipe out the ecology of the Bay and in this case the menhaden fishery in Virginia is benefitting only itself and a very few jobs.

As a previous resident of Maryland for 60 years, and USCG master Captain, I personally witnessed the effects of Menhaden depletion on the Chesapeake Bay Striped Bass fishery. The fact that the factory ships have continued to operate unbridled for years is a complete failure, and goes against all common sense for the fishery and ecosystem of the Bay. It is lomg past time the politics support this stop. In addition, it is long past time that the commercial Striped Bass fishery in the Chesapeake be shut down, and only a managed recreational fishery exist. Stop the Omega fishery!

I live on the Chesapeake Bay. We have always noticed the osprey flying over and frequently landing on our dock. As an admirer of Audubon's prints of birds, the osprey carrying its menhaden fish with the classic forward direction is truly an emblem of CHESAPEAKE BAY HERITAGE! How could anyone want to lose that. I have photos and videos of the osprey landing on our dock and eating or flying over our house to a protected creek to feed it's young on their nests. Last year we put up a tall perch on our dock and also a very small feeding platform for them (never big enough to build a nest which wouldn't last with the Bay winds). This year there have been very few to land on our dock.

When there are other sources of fish oil, etc. for the commercial industry overfishing MY MENHADEN that supports the fish we love in not only inhumane it is illogical! MicroAlgae Farming is just one alternative. Insect protein another and there are so many more. PROFITS! Virginia is the only state left that doesn't prohibit this inhumane fishery industry. Please stop it now! Thank you.

I would encourage the Atlantic States Marine Fisheries Commission to strongly consider reducing the cap how many menhaden can be fished out of the Chesapeake Bay. We have seen significant declines in the osprey population in Connecticut, with greatly reduced number of successful nests and fledglings, due to lack of food. Connecticut had made great strides in improving the osprey population in recent years, and that success is being undone. I myself have seen the impact; since last year, the large schools of menhaden that I would normally see in the harbor in Milford, CT every year have been absent. This gap in the food supply chain is having harmful impacts on the other animals that depend on those fish for food.

Please consider reducing the menhaden cap, to help reduce the impact it is having on other parts of the ecosystem.

Thank you,

Nicholas Edwards
Milford, CT

Please consider reducing the Menhaden fishing cap in the Chesapeake Bay by 50% as strongly recommended by the CT Audubon Society and other environmental groups. And consider other measures that might result in a bigger supply of Menhaden as food for birds and other wildlife. As is clearly demonstrated by the significant reduction in number and survival rate of osprey chicks over the last few years, and especially in 2026, the careless overfishing is causing starvation and reduced fertility in the birds that depend on Menhaden.

We don't have to wait for the bird populations to completely crash, as happened with the bald eagles and peregrine falcons (and others) caused by the pesticide DDT.

The evidence is clear and compelling. Please DO SOMETHING to help restore the balance and food supply needed by the osprey and similar wildlife.

Thank you very much.

Atlantic menhaden are a vital forage fish serving as the foundation of the marine food web along the U.S. Atlantic coast.

For any group, much less one company, to take ~70% of this vital foundational resource for their own profit, is unsustainable, which is obvious, even to a non-expert. The total percent of menhaden taken by ALL types of fishing in any year should be no more than half that, or 35% due to the enormous downward pressures and losses of other necessary wildlife, like Ospreys.

In another year or two at current levels, Ospreys are not the only bird or wildlife that will be near extinction levels.

We need only use common sense to set catch limits, but by all means please use well done, highly valid studies and work to return to what has been normal for Ospreys and other affected species and limit human menhaden catches to allow the Chesapeake Bay to flourish in all ways.

Thank you.

I live right beside Long Island Sound in Woodmont CT and actively support the Osprey Nation. My comment asks the Fishery Commission to reduce the Chesapeake Bay menhaden fishery cap by 50%. This reduction will support the population of Osprey that mainly feed on fish and so depend on an abundance of prey species like menhaden.

Once, the restoration of the Osprey was a success story in such strongholds as Old Lyme's Great Island. This year, only five chicks fledged there. As a participant in community science, I have also seen evidence of increased Osprey nest failures. Our observations and reports for August 2025 showed that about 1 in 6 nests failed; for this year, 2026, roughly 1 in 4 nests failed.

Please reduce the fishery cap for Chesapeake Bay menhaden by 50% and ensure that the Osprey can again be a successful presence along our Atlantic shores.

Please protect the menhaden, a primary source of food for our local Osprey and also Bald Eagles. Without the protein from the menhaden, the shells of the female Osprey's eggs are not strong enough to survive hatching. We need to keep our ecosystems as much in balance as possible, and the overfishing of menhaden has had deleterious effect on our birds. Ideally, it would be paused for several years. And at the very least, it should be limited/restricted. Thank you for your serious consideration of this matter.

Close the harvest of menhaden on the Chesapeake Bay. The benefits of closure will accrue to not only the ospreys who are being devastated, but watermen, fisheries, and various other species. Just like the rockfish, takers were warned of a crash. They ignored it, and the species crashed. The same was true of cod in the Atlantic and other species. Unless you close the fishery for menhaden, just like the crabbers, the clammers, the lobster men, and the oyster men, the harvest was their livelihood so they would attempt to take them until there weren't any more.

It's shocking and so sad to me that such disregard for the osprey population has been allowed to continue. At this point the only solution that will allow the osprey population to recover is a complete ban of harvesting for rendering of the Atlantic Menhaden. Cooke Inc. of Canada should be held responsible for this terrible ecological state of affairs.

I am writing as a Maryland resident and someone who cares deeply about the Chesapeake Bay and the wildlife that makes this place so special.

Every summer, I look forward to seeing ospreys along the Bay. Their return, their nests, and the sight of parents carrying fish back to their chicks are part of what makes the Chesapeake feel alive. That is why reports of ospreys struggling to find enough food and declining reproductive success are so deeply troubling to me.

Menhaden may be small, but they are enormously important. They are a foundational part of the Chesapeake Bay food web and an important source of food for ospreys and many other fish, birds, and wildlife. Removing large quantities of menhaden for industrial reduction has consequences that reach far beyond the fishery itself.

We should be asking a basic question: How many menhaden does the Chesapeake Bay need to remain a healthy, functioning ecosystem?

Until we can answer that question with confidence, I believe we should err on the side of protecting this essential forage fish

rather than continuing intensive industrial harvest.

I urge the Atlantic States Marine Fisheries Commission to adopt the strongest reduction under consideration in Draft Addendum II: a 50% reduction in the Chesapeake Bay reduction-fishery cap. I also support better distribution of harvest throughout the season, while recognizing that this alone will not address the need for sufficient menhaden during the critical osprey breeding season.

If the science ultimately shows that the Bay can sustainably support a larger harvest, we can adjust management accordingly. But if we wait until osprey populations, fisheries, and other wildlife have suffered significant and potentially irreversible declines, it may be too late.

The Chesapeake Bay belongs to all of us, and so does the responsibility to protect it. Menhaden are part of the Bay's living infrastructure. Protecting them means protecting the ospreys I love watching, the fish and birds that depend on them, and the health of the Bay itself.

Please put the health of the Chesapeake Bay ecosystem first and substantially reduce the industrial menhaden harvest.

Thank you for considering my comment.

I strongly support the 50% reduction in current Menhaden harvests in Virginia.

Chesapeake Bay watermen are seeing Menhaden catches plummet, blue crab fishermen are spending more on bait, and Osprey chicks are starving to death.

I strongly favor thoughtful, major restrictions and quotas on farming Menhaden in the Chesapeake Bay. Commercial fishing is greatly disrupting the ecosystem and threatening the survival of Osprey as well as other birds including Bald Eagle, Brown Pelican, Common Loon, and Royal Tern, and fish that consume Menhaden.

When the fish disappear, the Ospreys starve

I am the current president of the Harford Bird Club in Maryland. On behalf of my 175+ members, I urge you to stop & regulate this unconscionable practice.

The numbers show just how serious the crisis has become. In the 1980s, Chesapeake Ospreys were producing enough young to sustain their populations, averaging about 1.15 fledglings per nesting pair; today, in the most affected areas, production has fallen to just 0.25 fledglings per pair—less than one-quarter of the level needed for replacement. ([AP News][1]) Menhaden, which historically made up roughly 75% of the Osprey diet in the 1980s, now account for less than 30% in the mainstem waters where much of the Bay's Osprey population breeds.

The consequences are heartbreaking: chicks are starving, nest failures are increasing, and many adult pairs are no longer attempting to breed. Recent peer-reviewed research has documented widespread reproductive deficits in Chesapeake Bay Ospreys, while other research has also identified factors such as salinity that contribute to the decline, underscoring the need for careful, science-based management. ([Frontiers][2]) Menhaden are a critical forage fish for Ospreys and many other

species, and the Atlantic States Marine Fisheries Commission is already considering reductions in the Chesapeake Bay reduction-fishery cap. ([ASMFC][3])

I urge Maryland fisheries officials to act now: protect enough Menhaden in the Chesapeake to ensure that Ospreys and the broader Bay ecosystem have the food they need to survive and recover. We have watched the numbers fall from levels that sustained healthy Osprey reproduction to levels that cannot sustain the population. We should not wait until this conservation success story becomes another crisis.

It is so hard to imagine how we all too easily ignore just how much we are despoiling our environment - and to what end?? Not only are we losing humans to climate change, we are ignoring our fellow creatures who depend on our actions for their lives. Menhaden is vital for our Osprey - might we really not be reasonable about how to share the bounty (if one might call it that) of fish by supporting the Menhaden Draft Addendum II. Lets work to find ourselves doing positive actions to demonstrate our recognition of the value of saving our environment.

Greetings,

The history of human interaction with natural resources shows that we have often been highly effective at driving species toward depletion. Unfortunately, current trends suggest that Atlantic Menhaden—and the many species that depend on them—are once again on a troubling trajectory.

Although commercial quotas are established to manage Menhaden harvests, enforcement remains insufficient. When quotas are exceeded, violations frequently go unaddressed, undermining both the intent and credibility of the management process. Science based stewardship should guide decisions that affect our coastal ecosystems. Yet too often, political influence and financial interests overshadow ecological concerns. We must place greater value on conserving and protecting our natural resources rather than prioritizing the production of cat food, cosmetics, and fish oil at the expense of Menhaden and the interconnected species that rely on them.

I am hopeful that the Commission will implement strong, forward-looking measures to rebuild Menhaden populations. However, it is important to acknowledge that such actions will affect local employment, particularly within Virginia's Northern

Neck. To ensure fairness, the development of a program to support workers who experience economic hardship as a result of needed conservation measures should be a priority. The Tobacco Transition Payment Program offers a successful model of how such assistance can be structured without relying on taxpayer dollars.

Thank you for your consideration.

Sincerely,

Dr. Claudette Carter Henderson

The importance of menhaden to the Chesapeake Bay ecosystem can't be overstated. So many other species depend on a healthy menhaden population that a serious decline in that population would have a devastating impact on the bay.

It is past time to take steps to place more effective limits on the menhaden fishery. Tying the bay harvest to the TAC value would be a logical step, and having a schedule to revisit the caps on a regular basis is also necessary. I think it's important to set catch limits at a low enough level to ensure this keystone species is able to maintain itself. Enforcement of those limits is also a requirement.

It's time to look past short term economic impacts and consider the much larger impact a collapse of the menhaden population would have on the bay's ecosystem and its surrounding communities.

Dear Commissioner, September 14, 2026
I am writing to share my experience with the effects of Menhaden overfishing on our local wildlife. It has been 2 years since I was walking along the Gunpowder River near my home in Monkton, Maryland and had an experience that has had an important impact on me and my understanding of the environment. I live fairly close to the headwaters of this important local tributary to the Chesapeake Bay. During a morning hike with my dog, I encountered an Osprey lying nearly motionless in the grass surrounding the river. I called the nearby Phoenix Wildlife Rehabilitation Center for advice and they recommended bringing the bird in.
When we inspected the Osprey there was no visible injury, except for a noticeable loss of muscle mass. Despite an attempt to rehydrate and feed the bird it died within the next day. The assessment was that it had starved to death. With further consideration of the Ospreys last days, it had expended it's final energy trying to find food by following a tributary to the end of the river, where it collapsed and died of starvation. Although there was nothing that I could do for this bird I was motivated to volunteer at the wildlife center and try to help other wildlife in need of care and rehabilitation.
Although most of the animals brought to our center have been injured or are too young to survive after separation from their nests, many are suffering from malnutrition or starvation. It has made me very aware of the effects of loss of habitat or resources that are contributing to a loss of wildlife.

I believe that improper resource management, like overfishing of essential food sources, is something that needs to be corrected. Although I understand that this impacts jobs in the the important fishing industry; logically overfishing will ultimately result in the loss of these jobs unless they can be directed to sustainable fisheries. The use of this important food source as an inexpensive protein and supplement source also seems wasteful to me.
In closing I hope that this issue can be resolved in a way that is satisfactory to both fishing and larger environmental concerns. I believe that with some planning and thoughtful consideration of other alternatives that this process will be beneficial to everyone.
Sincerely,
Steven Wilson

It's all BS.. Anyone that can throw a cast net can see that there is no shortage of anything in the bay except shoreline and clean water as every inch of land surrounding it is being drained into it … All this crying about menhaden has been going on my whole life by anti fishermen that have now brainwashed recreational fishermen along with the foundations calling for and allowing violent conversations about shooting and destroying watermen and gear that needs to stop… They all need to be held accountable for inciting of violence and the only laws that need to be made are laws against that inciting of violence against watermen… If this commission or public comment section does anything at all, it needs to address this attack on watermen and these foundations held accountable for that inciting of violence and nothing more.. Protect the watermen of this Country and our seafood industry and stop the catering to the anti groups collecting grant money to ruin the live of our watermen and this countries seafood industry… You can't go anywhere in the bay and throw a cast net and ever come to any conclusion of sanity that anything is starving …. It's BS..

I strongly urge you to lower and tighten the Chesapeake Bay cap on industrial menhaden harvesting.

Menhaden are essential to the health of the Chesapeake Bay. When they thrive, everything else thrives—striped bass, bluefish, crabs, osprey, and our coastal communities. But when an industrial fleet is allowed to harvest millions of these vital fish out of our sensitive nursery waters, the damage multiplies straight into Virginia's working waterfronts.

Local watermen, family-owned seafood docks, and packing houses depend on a healthy, balanced marine food web. So do charter boat captains, tackle shops, marinas, and the thousands of everyday fishermen who feed tourism. Together, Virginia's commercial seafood industry and recreational saltwater fishing generate nearly two billion dollars in economic vitality and hundreds of millions in state and local tax revenue. That revenue paves our roads, funds our public schools, and keeps working coastal towns alive.

We should not sacrifice the livelihoods of thousands of watermen, small business owners, and fishing families to enrich a single industrial operation. These waters and these fish belong to all of us. Please stand up for the Chesapeake Bay, defend our coastal heritage, and enact meaningful caps to protect Virginia's fisheries for generations to come.

Please ensure that there are enough menhaden migrating to Long Island Sound to sustain and even enhance the populations of osprey, eagles, striped bass, and other keystone predators in the Connecticut and northern Long Island, NY areas.

Connecticut has had a huge success in the osprey and eagle populations rebounding since the 1970s, after DDT was banned. The osprey population increased from 12 to over 1500 adults recently. Their main food is menhaden. Unfortunately, Connecticut has experienced a decline in fledglings per nest, with many long-time observers reporting starving osprey chicks.

Please help the iconic predators along our shoreline and in our waters.
Thank you,
Barb Kamicker, a birder and nature lover for >50 years and member of several birding organizations

I strongly support these actions, ASAP:

* Reducing the initial Chesapeake Bay Cap by 50%, from 51,000 to 25,500 metric tons.
* Establishing the Bay Cap at 13.6% of the coastwide total allowable catch so it can adjust when the coastwide quota changes.
* Maintaining 51,000 metric tons as the maximum Bay Cap, with no fixed lower limit.
* Allocating 25% of the Bay Cap during the first quota period, 25% during the second period, and 50% during the final period.
* Requiring early-season quota-period overages to be deducted from the corresponding period during the following year.
* Requiring ASMFC to revisit the Chesapeake Bay Cap and related management measures every three years.

Connecticut Audubon is urging the commission to reduce the fishery cap by 50% to help ensure enough menhaden remain available for Ospreys and other wildlife. I am in support of their recommendation.

Menhaden is a crucial part to Maine's coastal fishers. As herring quotas not nearly what they were menhaden has offered an affordable, and locally available bait in summer months one busiest time for Maine lobster fisheries. Therefore without it our younger and smaller lobster boat like mine will struggle. Especially sense the price lobster has stayed same at the doc for past 20+ years, but every single thing else had doubled. If the cuts to quota continue put a lot of pressure on a already overly pressured fishery and make it that much harder to make a living on the coast.

Atlantic Menhaden Draft Addendum II

We humans have been very successful and efficient in decimating and wiping out entire species. Again, we are on a downward spiral to ensure the Menhaden, along with collateral damage of other species are in jeopardy.

Quotas are established on commercial fishing, but they are not enforced and the violators are not fined when they exceed their quota.

Political contributions and greed drive the decision-making/enforcement process, not science.

Certainly, we can place higher priorities to conserve and protect natural resources than manufacturing cat food, cosmetics and fish oil at the expense Menhaden and the interlinked species.

Presumably, the Commission will take bold steps to rebuild Menhaden populations. However, in doing so, local jobs will be lost resulting in severe impacts to the economy of Virginia's Northern Neck. It is only fair and reasonable that a program be

developed to compensate and assist employees who are adversely impacted. A good example of such program is the Tobacco Transition Payment Program, entirely funded without tax dollars.

Thank you for your serious consideration. Connecticut Audubon is urging the commission to reduce the fishery cap by 50% to help ensure enough menhaden remain available for Ospreys and other wildlife. I support this reduction. In my lifetime, living on the Connecticut coastline, I have watched the decline of Osprey and then a resurgence due to conservation efforts. This year there was a noticeable decline in the pattern of Osprey chicks learning to fly and hunt in the cove near my home. The male Osprey were less frequently at the nest, and and more frequently circling the water. Menhaden schools are smaller, and less visible than I have witnessed in past years. I believe Osprey are a pretty good indicator of the ecosystem. I think it's time to revisit fishery cap and err on the side of maintaining a healthy marine ecosystem.

This isn't nearly enough! The limit should be reduced 50% next year, and the year after that and the year after that!

At no point EVER should we prioritize a business's ability to function over the health of our bay. Full stop. This business should be banned from operating due to the corruption and gross negligence in regards to the health of our Chesapeake Bay.

We should follow Florida's example and this type of fishing from our waters. While I feel for the few employees this company employs, if they want to continue to work the water, they can obtain captains licenses and become fishing guides.

Screw Omega protein for all the damage they've done and all the lying about the environment they've done. They are not welcome here.

Signed, a concerned angler who has witnessed the rape of our Bay since the late '80's.

Members of the Atlantic States Commission, Thank You for hearing my comments on the menhaden addendum 2. I would like to say that the menhaden TAC for the East Coast needs to be put into a more regionalized management schedule. I understand the main reason for this addendum is the displeasure with Omega having such a huge quota of the TAC, and the sport fishing , and conservation groups are blaming the Canadien Company for many changes happening in the Chesapeake. Meanwhile way up here in Maine , and other parts of the NorthEast, including the Maratimes of Canada, we are experiencing high numbers of menhaden, not seen in the last 20 years or so. This will be the third cycle I have seen in my 62 years.These fish may stay forever, or cycle thru as they have in the past, hard to say. I can say that the scientists always tell us as fishermen in Maine that climate change will bring new species for harvest, but will also drive the current ones further north, out of our grasp, so be prepared. Right now we are seeing very large numbers of large schools of menhaden, as we did the past 6 or 7 years, many offshore in deeper water. I know that the biomass north of Rhode Island is unknown to the regulators, as it was admitted in the hearing I sat in on this spring with the ASMFC board. There is zero science in Maine. We have large fish that will die off this winter, yet we are forced to buy product from southern states that is tiny , peanut bunker. This fish is all in the same TAC quota, tasing of local caught large fish, for small imported fish from the same TAC.This makes no sense at all, especially with the logistics cost of shipping a fresh product up to Maine. We lost at least 6 weeks of fishing this season with the 20% reduction implemented for the TAC this year, and another 30% will be devastating to the Maine lobster Industry.We

will be forced into using frozen product from foreign countries, when we have a large biomass capable of keeping the fleet supplied with bait, and also another entire fleet of seiners , separate from the lobster fleet, working till well into the fall. This means many jobs in a struggling economy on a coast where tourism is taking over. Many coastal families rely on commercial fishing to survive where we have lived for many generations, mine being the tenth generation, and I have kids and grandkids coming along behind me. If the Chesapeake is in as bad of shape as I read about by a couple pages on the internet, there should be regional management to alleviate the problem, without have a ripple effect to us here in Maine.I do not know the numbers exactly, but the 400 permitted boats in Maine do not catch 1/4 of the quota that Virginia has. We also start our season to early, but we are told by the ASMFC , that we will not qualify for additional quota If we do not fill our state quota by a certain date. This is really unfortunate because we really need the bait later in the summer into early fall, before the fish leave for offshore. I do not feel we are well represented on the Commission, and a more common sense approach would serve the fisherman of Maine better. When this cycle passes by, we will want to import fish from southern states, but while the fish are here, we need to utilize the resource. Times are rough in our business with the cost of operation outpacing the cost of the product. The low, competitive price of the menhaden has been a Godsend to the fishermen of Maine. I personally fished menhaden into November last year, with large schools of fish still around, but just in to deep of water for our relatively small and shallow nets. We have a vessel length size restriction, and other conservation methods to keep the overfishing threat to a minimum. I wouldn't mind a net restriction if 100 fathoms long, if it meant we could retain a sizable quota. We are about done this season because of the 20% reduction, and this will be a hardship for the lobstermen , as they see the large amounts of menahaden still here well into the fall, but un accessible.These are just a few of my thoughts, Thank You for your consideration Douglas McLennan F/V Nora June, Speuce Head Maine

I would encourage those in charge to not only reduce the amount of menhaden that can be taken by reduction fishing companies (Omega), but to completely stop that type of fishing for a period of at least 2 years, to allow the species to recover. All other Chesapeake Bay states have made reduction fishing illegal; what is wrong with Virginia? Are our representatives in cahoots with the lobbyists? Year after year, a proposal is made to study the number and health of the menhaden population, and those in charge have consistently refused to even vote on a study!

Finally, our new governor has put aside funding for a study. Again, I would like to see a complete stop to reduction fishing in the Bay, and especially in the Rappahannock River! It is obscene that those net fishers are allowed in the river. It's not only menhaden that they catch, it's anything that gets caught in the nets.

Residents have confirmed that the osprey population has dwindled in the past few years, likely due to reduction in menhaden. Striped bass are also suffering.

Wittman seems to care more about the handful of jobs in Reedville than the livelihood of watermen across the Bay. I recommend the state of Virginia support the Reedville staff of Omega for one year, giving them a chance to find other work

while reduction fishing is stopped to let the species recover. If and when it is reopened, they should be confined to only Atlantic fishing, NOT in the Chesapeake Bay.

I am writing in support of Draft Addendum II and the proposed reduction of the Chesapeake Bay reduction fishery cap by up to 50%, as well as the establishment of quota periods to better distribute harvest throughout the fishing season as brought to my attention by the advocacy work of the Connecticut Audubon Society.

Atlantic menhaden are one of the most important forage species in the Chesapeake Bay ecosystem. They serve as a critical food source for a wide variety of fish, birds, and marine mammals, including striped bass, bluefish, ospreys, bald eagles, and other species that depend on healthy menhaden populations. The Chesapeake Bay is also a vital nursery area for many commercially and recreationally important species, making the availability of forage fish especially important within the Bay.

The Chesapeake Bay cap was originally implemented as a precautionary measure in response to concerns about localized depletion. Since its adoption, fisheries managers have repeatedly recognized the ecological significance of the Bay and have adjusted management measures accordingly. The cap was reduced by 20% through Amendment 2 in 2012 and further reduced to 51,000 metric tons through Amendment 3 in 2018 to better reflect historical harvest levels and the Bay's importance as essential habitat.

Recent concerns regarding the concentration of fishing effort and its potential impacts on other fisheries, wildlife, and ecosystem health warrant additional precautionary action. A further reduction in the cap would help ensure that sufficient menhaden remain available to support predators and maintain ecosystem function. Establishing quota periods would also help spread harvest pressure more evenly throughout the season, reducing the risk of localized depletion and providing more consistent ecological benefits.

The Atlantic States Marine Fisheries Commission has an opportunity to strengthen ecosystem-based management by prioritizing the role of menhaden as a forage species and protecting the ecological integrity of the Chesapeake Bay. Reducing the reduction fishery cap and implementing seasonal quota periods are prudent, science-based measures that will help safeguard the Bay's resources for future generations.

In my area, where there have normally been around 18 offspring of osprey each year, there were only 2 this year.

Thank you for considering my comments and for your continued commitment to sustainable fisheries management.

As a resident of Drum Point in Calvert County living on Mill Creek for the past 10 years, we have enjoyed having the Osprey come back every year and fish here. raise their young here and have plenty to eat throughout their stay.

This year we may be had two occupied nests with perhaps two surviving young. How can anyone think that it's OK to knowingly remove the food source from these beautiful raptors to the point of starvation? Especially when there are other means for producing what the Menhaden are used for.

The Osprey just like any other force of nature is in serious danger and extremely vulnerable because of greed and useless power.

Please pass this reduction and ensure the LAW is enforced because there will be those who cannot see past the dollar sign.

The Osprey are magnificent creatures and we need them to plentiful again with healthy young and strength for their migration!

Very concerned Calvert Countian,

I support the addendum to reduce menhaden harvests.

The Chesapeake bay fishery has been in steady decline and the high menhaden harvest clearly has an impact. There is less bait and less reproducing fish and its affects can be seen rockfish numbers all along the mid-Atlantic.

The new study linking menhaden harvest to low osprey reproduction is concerning and shows the impact is more then just fish populations.

My husband and I have been sailing the Chesapeake Bay for nearly 20 years. This year we noticed there were virtually NO osprey south of Herring Bay. The nests are empty or absent. Even mid-bay we noticed smaller and fewer osprey. I understand the need to catch menhaden, but it would be lovely if we could share some with the native wildlife. Thank you for considering either decreasing the total catch, or spacing the catch out so that there are menhaden available for osprey and other fish that depend on them. Please adopt Draft Addendum II
Thank you.

Dear Commission:

My name is Nick Webb, and I am Chairman of the Clinton (CT) Conservation Commission.

I am writing today to ask you to make a very difficult decision and reduce the menhaden cap by 50%. As I am sure that you are aware, the Osprey breeding season in Connecticut was a complete flop. I saw it here in Clinton first hand. Nest after nest were empty of chicks. The number of ospreys flying overhead with a fish in their talons was greatly reduced.

We have seen this story before, and the resurgence of the Osprey has been a miracle. Please help them be making a decision that you know is right, but also tough.

Thanks for your attention.

Nick Webb
Chairman of the Clinton Conservation Commission

I support the ban on rendition harvesting of Menhaden fish before they become extinct, losing forever the vital role they play in maintaining the ecological balance of the Chesapeake Bay.

If a total ban can't be implemented, I would support a 50 percent reduction of the harvest.

Have we forgotten that our population of ospreys was earlier rescued from the ravages of DDT? Now the ospreys must be rescued from the loss of food they need to survive, lay eggs, and feed their young. It would be a shame to lose them and their contribution to the Chesapeake ecology.

As a canoeist among Chesapeake estuaries, I would also miss watching those wonderful birds plunge from the sky into the water to catch their fishy menhaden prey. I pray for the prey of the osprey!

Subject: [External] Atlantic Menhaden Draft Addendum II and 2027–2029 Catch Limits

Categories: Menhaden 2 Auto Replied

Dear ASMFC,

I am a sports fly fisherman, from Massachusetts, and there are few things I love more than flyfishing for striped bass from the shore. The last few years, in Massachusetts North Shore, where I fish, I have noticed an alarming and steady decrease in the numbers of schoolie sized stripers. This year, I saw none...None! Just 5 years ago, every morning, the water was practically boiling with the schoolies. While I did catch some keeper sized fish this year, there is no doubt that the current lack of schoolies is going to translate into fewer keeper sized fish in the coming years. Other fishermen in Massachusetts and Maine who I spoke to have seen the same decrease. I strongly believe this is due to the lack of spawning successes in the Chesapeake Bay rivers, and I further believe the lack of spawning success is due to scarcity of menhaden for the spawners. Sure, there are other possible causes of the disappearance of the young stripers, but the menhaden fishery is the most likely cause, and this fishery can and should be more strictly regulated. Please, do the right thing, and stand up strong to the industrial lobby representing the reduction fisheries. They will say over and over that there is no proof, but it is literally a red-herring argument. It is obvious to anyone that the industrial annual removal of 50,000 metric tons of menhaden will have a major trickle down effect on every predator in the local environment. This amount of reduction must be reduced substantially. Not 10%, not 20%. It must be reduced to as low as possible (zero is preferable) until menhaden are abundant again in Chesapeake bay and easily findable by the all the key predators : osprey, stripers, other fish, whales, dolphins, and humans as well). A moratorium on menhaden harvest should be in place until the menhaden are back in force, and then the reduction fishery should be gradually re-introduced, and scaled so that it has no observable impact on the menhaden abundance. This will be tough on the reduction fishing industry, but make no mistake, the status quo is going to lead to even bigger losses for many other industries as the predators of menhaden also disappear. And not just monetary losses, but the loss of family and cultural traditions all up and down the east coast.

Thank you,
Tom Serwold
Boston, MA

Subject: [External] Atlantic Menhaden 2027-2028 TAC

Categories: Menhaden 2 Auto Replied

ASMFC reports that recreational harvest accounts for only about 1% of Atlantic menhaden landings, meaning that virtually all menhaden harvested are taken by commercial fisheries. Menhaden are a public fishery resource and I believe their management should place greater emphasis on the benefits they provide to the broader public and the marine ecosystem, rather than primarily on their value after commercial harvest.

As a saltwater fisherman, underwater photographer, and biologist, I would like to see more menhaden remain in the ocean. Menhaden are a critical forage species that transfer energy from plankton to larger predators and provide an important food source for species including striped bass, bluefish, tuna, marine mammals, and seabirds. Their value therefore extends far beyond the value of the fish that are commercially harvested.

More abundant menhaden can benefit recreational fisheries, wildlife viewing, marine predators, coastal ecosystems, and the people and businesses that depend on those resources. I would like to see menhaden managed first and foremost for their ecological role as forage and for the broad public benefits that result from healthy and abundant menhaden populations.

A healthy marine food web requires a strong forage base. Menhaden are an important part of that base, and removing them from the ecosystem has an opportunity cost: every fish harvested for reduction or bait is a fish that is no longer available to support predators and the surrounding ecosystem.

Please manage Atlantic menhaden as the important public resource they are, with greater consideration for the anglers, wildlife, coastal communities, and marine ecosystems that benefit from abundant menhaden, and not primarily for the commercial interests that harvest them for products such as fish meal and fish oil.

Thanks for your time,

Peter Abdu

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):

I am writing as a Maryland resident who has lived in and/or maintained family ties to St. Mary's County since 1973 and has developed a deep personal connection to the Chesapeake Bay. I grew up on the water and someone who spends considerable time on and around the Bay. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base. Each year around St Patrick's Day, my family watch for the arrival of the ospreys who return to their same nest and give birth to and raise their young. This year the parents arrived but no chicks were ever hatched.

I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.

The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - **menhaden.**

Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. **Where and when the fish are removed matters.**

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.

I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.

For that reason, I urge the Commission to establish **strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months**. Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coastwide fishery.

There is also an important management issue that deserves attention. The Commission's coastwide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.

I respectfully urge the Commission to:

1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.

2. Establish firm seasonal quota periods for menhaden.

3. **Prevent excessive concentration of reduction harvest during the summer months.

4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.

5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.

I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting.

The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake Bay users and stewards.

Sincerely,

Mary Bowes

St. Mary's County, Maryland

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

To Whomever Menhaden Concerns,
I have owned waterfront property on the Honga River in Dorchester County, Maryland for almost 20 years. The Menhaden schools used to team here. Beneath them were hundreds of Rockfish and Blues, and above them were countless gulls, Osprey, and Eagles. The everyday fishing was a sportsman's dream.
I have witnessed an alarming steady decline in all of the aforementioned species, particularly in the last 5 years. I watch low-flying spotter planes hone in on Menhaden schools and the not too far behind lighted trawlers come eradicate them. Meanwhile, my resident Osprey pair hasn't successfully hatched any young in 3 consecutive years. The number of Eagles has dwindled from dozens to just a few. And the fishing? I haven't landed a legal fish OF ANY SPECIES since the fall of 2025. I am sickened by the loss and lack of regulation causing it. Anyone that denies a connection to the Menhaden fishery assault and the consequential habitat losses across the entire Chesapeake Bay ecosystem is a fool. Action to stop the Menhaden annihilation needs to be immediate if we hope to save the food chain.
Thank you for caring,
Susan McGuirk

Subject: [External] Atlantic Menhaden Draft Addedndum II

Categories: Menhaden 2 Auto Replied

To the Atlantic Menhaden Management Board,

I'm writing to support the most conservative options in Draft Addendum II for Atlantic Menhaden management.

Specifically, I support:
Cutting the Chesapeake Bay Reduction Fishery Cap by the full 50% to align with the 2025 stock assessment findings
Linking the Chesapeake Bay Cap to the coastwide total allowable catch so both adjust together
Spreading the Bay harvest across quota periods to prevent the Bay from being stripped in spring and summer
Reducing the coastwide catch limit by 40% to meet the ecological reference point target for 2027 and beyond

The 2025 assessment showed the menhaden population is significantly smaller than previously estimated, and science indicates a 50%+ reduction is needed to protect striped bass, whales, ospreys, and the broader saltwater ecosystem that depends on menhaden as a keystone forage species.

Thank you for considering my comments and for taking action to protect this critical resource.

Colin Dowd

Subject: [External] Atlantic Menhaden Coastwide TAC 2027-2028 - Public Comment

Categories: Menhaden 2 Auto Replied

To the Board,

I write today with grave concern yet again as we must submit 2 separate comments to voice our opinions on the proposed Menhaden harvest. My previous comment held my frustration at the Board's inaction and lack of precautionary management more broadly, so I will keep this comment relating to coastwide TAC brief.

I support the maximum cut currently proposed to the coastwide TAC (50%), but would like to state my support for a full harvest moratorium on Atlantic Menhaden until they are no longer overfished, nor are any of the species the ASMFC manages. This would mean no harvest of Menhaden until their populations and the ones they support are recovered, such as striped bass which the ASMFC has mismanaged to the brink of stock collapse. This is the ASMFC's most effective avenue to manage all other fisheries in their jurisdiction for abundance. Why they support commercial interests extracting this resource and selling it for the lowest cost possible, neglecting the ecosystem services and true economic value in other sectors is unknown to me. We manage whales, dolphins, seals, sharks, and other predators to their historical abundance, but overfish their food resources and wonder why interactions with humans and depredation are increasing as problems. Manage the base of the ecosystem for abundance, and you may have abundant fisheries again.

I am 18 years old, and this year is the first year I have gotten truly into surfcasting. I love It and have been lucky enough to both meet and fish with some people who have been doing it much longer than I have. It is clear to see that the fishery isn't healthy. One major thing that both I and those more experienced than me notice is the lack of menhaden. I am writing to urge you to reduce the Chesapeake bay TAC of Atlantic Menhaden by 50 percent, and the coast wide TAC by at least 40 percent in order to protect not just striped bass, but whales, sharks, other fish and simply every aspect of our amazing and crucial ocean ecosystem. Additionally this would protect thousands of livelihoods up and down the Atlantic coast that rely on this important resource.
Thank you.

Board members,

I am an Osprey Steward in CT of 5 years, located along the shoreline. I have witnessed a significant downward turn this year in the viability of the osprey population, especially their young, which in large part I feel is related to a lack of an available food source.

I support a 40% reduction to approximately 112,100 metric tons for years 2027 and 2028.

Thank you for your time and consideration into this matter.

Respectfully,
Shelley

Dear Atlantic States Marine Fisheries Commission:

I live on the Chesapeake Bay in North Beach, Maryland. I'm extremely concerned with the drastically declining population of osprey we are now experiencing. Residents care about the fragile ecosystem of the bay and we are very concerned with what is occurring.

I strongly support the 50% reduction in the Chesapeake Bay reduction fishery cap (Option B4/reducing the cap to 25,500 metric tons) and I support seasonal quota periods.

Nest failures for ospreys are occurring everywhere along the bay. We are also seeing population distress among striped bass. This signals an urgent need for precautionary conservation measures before this situation gets even worse.

We need strict quota periods that distribute harvest evenly across the year rather than allowing an intense summer harvest of over 100 million pounds of fish. This harms not only the wildlife populations, but watermen, anglers and coastal tourism economies too.

Kindly understand the urgent need for this conservation effort before it's too late.

Very Respectfully,

Patti Stueckler

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Members of the Atlantic Menhaden Management Board,

As an avid recreational angler and conservationist, I am writing to express my strong support for increased protections for Atlantic menhaden under Draft Addendum II. Menhaden are arguably the most important fish in the sea, serving as the foundational forage base for striped bass, bluefish, bluefin tuna, osprey, and whales.

I urge the Board to support the following science-based management measures:

- **Reduce the Chesapeake Bay Reduction Fishery Cap by 50%:** A substantial cut to the current industrial harvest cap is necessary to address declining pound net harvests and relieve localized depletion in the Bay, which serves as a critical nursery ground.
- **Establish Seasonal Harvest Periods:** Distributing the industrial catch more evenly across the fishing season will mitigate heavy summer fishing pressure when nesting ospreys and other vulnerable predators need these forage fish the most.
- **Revisit the Bay Cap Every Three Years:** Mandatory, regular reviews will allow managers to actively integrate new Chesapeake Bay-specific data and ensure management goals align with the ecological needs of the ecosystem.

We cannot manage menhaden purely as an isolated commercial commodity without accounting for their invaluable role in the food web. Thank you for your time and your dedication to protecting our coastal resources.

Sincerely,

Todd DiNoia

Dear Atlantic States Marine Fisheries Commission,

I am writing in support of Draft Addendum II and the strongest possible reduction in the Chesapeake Bay menhaden catch limit, along with seasonal quota periods.

Menhaden are an essential food source for osprey, striped bass, and many other species that depend on a healthy Chesapeake Bay ecosystem. With osprey productivity declining so dramatically, I believe reducing the amount of menhaden removed from the Bay is an important step toward protecting these species and the health of the Bay.

Please support the strongest reduction in the Chesapeake Bay menhaden catch cap and seasonal harvest limits.

Thank you for considering my comments.

Sincerely,
Amanda Abrams

Categories: Menhaden 2 Auto Replied

To whom it may concern,

I live in Huntingtown, MD. I'm a frequent visitor of the bay. I also look for Osprey driving around Calvert. I look forward to see think return to the same nest every season. I've been watching some of the same birds for 11 years now, when we moved to Calvert. The situation noted below was brought to my attention and I find it incredibly sad and disturbing.

Researchers monitoring 937 osprey pairs across the Bay in 2026 found the worst breeding year on record. In the saltier portions of the Bay—where osprey depend heavily on menhaden for food—productivity fell to just 0.25 young per pair, far below the level needed to sustain the population. Researchers are documenting food stress and chicks starving in their nests.

The Atlantic States Marine Fisheries Commission (ASMFC) is considering Draft Addendum II, which could reduce the Chesapeake Bay industrial menhaden catch cap by as much as 50%—from 51,000 metric tons to 25,500 metric tons—and spread the harvest more evenly throughout the fishing season.

I am begging you to please implement this draft addendum II. SAVE OUR OSPREY!!

Best Regards,
Jana Cornelius

Subject: [External] Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Hello,

My name is Capt. Craig Cantelmo and I'm both a Fishing Tackle Industry Professional and a light tackle Charter Captain and have been affected negatively by the Menhaden Reduction fishery on Long Island thru the Chesapeake Bay. If and when we find schools of bunker the fish are dramatically smaller and (50% the size of historic fish) and much smaller then historically. This has kept game fish from being accessible to surf fisherman and inshore anglers.

I would like to choose:

- Support Option B4, cutting the Chesapeake Bay reduction fishery cap in half, from 51,000 to 25,500 metric tons.
- Oppose Option C, which ties the cap to the coastwide quota. It would let the cap rise automatically, with no addendum and no hearings.
- Support Option B1, three evenly split quota periods, with Underage Sub-Option 1.
- Support Option B, revisiting the cap every three years.
- A cut to the Bay Cap is conservation. It is not quota to be moved to another state.

We're overestimated the number of Menhaden in the water, we have overfished the population and there's never any accountability! This is a public resource that's being plundered by a small number of commercial fishermen that is having a dramatic effect on the recreational angler that contributes to far more jobs and income for local communities that include but not limited to: Tackle Shops, Tackle Manufacturers, Charter Boat Captains, Surf Fisherman, and the businesses that rely on the fishermen to sustain their businesses.

Please end the madness,

Craig Cantelmo

Subject: [External] Atlantic Menhaden 2027-2028 Ocean TAC

Categories: Menhaden 2 Auto Replied

Hi,

I am writing to urge the Atlantic Menhaden Management Board to implement at least a 40% reduction to the coastwide ocean TAC for the 2027 and 2028 season, setting a fixed cap at approximately 114,000 metric tons. As a UMaine graduate student performing a striped bass foraging ecology study in Maine waters, **menhaden comprise more than 30% of striped bass diets** in 2025-2026 (and even more during certain seasons and for larger fish).

Having the ability to manage menhaden with the current ecological model is exceptional, however preliminary data from the TC meeting shows that maintaining the current quota carries a 99.5% chance of exceeding ERP fishing targets. I strongly think that in lieu of this, **a 40% cut is the minimum precautionary action required to give our already overfished and struggling to rebuild striped bass stock at least a 50% chance of staying within safe ecological limits**. Striped bass rely heavily on menhaden in addition to Atlantic bluefin tuna who have drastically shifted their diets from Atlantic herring to Atlantic menhaden in the last several years, further reinforcing their importance as a forage fish (Nadeau et al. 2025).

I understand this is a large cut and the socioeconomic impacts will be difficult, but I believe that the alternative indirect and direct socioeconomic impacts for striped bass and other marine predators that rely on menhaden may outweigh this specific cut. I watch the commercial purse seine boats in Maine rivers absolutely wipe out the menhaden from places like the New Meadows River each year, and the striped bass then need to find alternative and less nutritious prey, decreasing their overall condition and putting their spawning success at additional risk.

Please consider taking a more significant cut than proposed for the menhaden ocean TAC before it is too late to salvage this forage fish that fuels our iconic predatory fish.

Thank you,
Abby

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Sir or Madam,

As you well know, the health of an ecosystem depends on all its constituents. The Atlantic menhaden are crucial for our coastal ecosystem which supports tens of thousands of jobs and billions in revenue.

I implore you to consider reducing the menhaden cap in the Chesapeake by 50% and the total coastwide catch limit by 40%. Honestly, it would be even better to include a moratorium on reduction fishing, since the latter benefits mainly corporate interests and relatively small number of jobs, while putting the entire ecosystem in harms way.

It is clear that the science has limitations. Given that, the only wise approach is to err on the side of caution or else we risk the health of many, many fisheries on the East coast. We have been down the road of overfishing before. We cannot afford to make the same mistakes again.

Thank you for your consideration.

Sincerely,
Marco Seandel, MD, PhD

-Colin

To the Atlantic Menhaden Management Board,

I am writing to support the most conservative options being considered in Draft Addendum II.

I strongly urge the Board to reduce the Chesapeake Bay Reduction Fishery Cap by the full 50%. I also support linking the Bay Cap to the coastwide total allowable catch, so that when one is reduced, the other is reduced as well.

Additionally, I support dividing the Bay Cap into quota periods throughout the year so that the harvest is not concentrated during the spring and summer months.

I also urge the Board to establish a coastwide TAC for 2027 and beyond that is consistent with the ecological reference point target. The 2025 stock assessment showed that the Atlantic menhaden stock is smaller than previously estimated, and the Board's own projections indicate that a reduction of 50% or more is necessary to meet the ecological reference point target.

Thank you for taking the time to consider my comments and for your continued efforts to properly manage this important resource.

Sincerely,

Colin Fitzgerald

To whom it may concern,

Please consider cutting the Chesapeake Bay cap for menhaden by the full 50%. Please consider linking the Bay Cap to the coastwide catch limit so when one drops, the other drops too. Please consider spreading the Bay harvest across quota periods so the Bay isn't stripped in spring and summer. Please consider reducing the coastwide catch limit by 40% to meet the science for 2027 and beyond.

The entire Atlantic coastal ecosystem depends on this bait fish. We cannot afford for it to crash. It would be detrimental to everything from predator fish, to ospreys, to whales. Everything is reliant on the atlantic menhaden and we should not and cannot continue the over harvest of the species.

Do what is right.

Thank you.

Ben

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Atlantic Menhaden Management Board,

I am writing to support the most conservation-focused measures in Draft Addendum II and urge the Board to take meaningful action to protect Atlantic menhaden and the broader coastal ecosystem that depends on them.

Specifically, I support:

• Cutting the Chesapeake Bay Cap by the full 50%.

• Linking the Chesapeake Bay Cap to the coastwide catch limit so that reductions in the coastwide limit result in corresponding reductions within the Bay.

• Spreading Chesapeake Bay harvest across quota periods to prevent excessive removals during the ecologically important spring and summer months.

• Reducing the coastwide catch limit by 40% to better align management with the science for 2027 and beyond.

Menhaden are a critical forage species supporting striped bass, bluefish, marine mammals, seabirds, and many other predators. Their value should be measured not only by how many fish can be harvested, but also by the ecological role they play when they remain in the water.

I urge the Board to take a precautionary, ecosystem-based approach and adopt the strongest conservation measures available in Draft Addendum II. Protecting adequate menhaden abundance, particularly in Chesapeake Bay, is an investment in the health and resilience of the entire Atlantic coastal ecosystem.

Thank you for considering my comments.

Sincerely,

Peter Nosal

Hello,

Please pass this addendum to reduce commercial Menhaden catch. I live on the north shore of Long Island, I have seen nearly zero adult Menhaden schools in my region in 2026. I am a recreational fisherman. We need to save the Menhaden for the marine life and birds that rely on this vital resource.

Thank you,
Steve Wolf

Categories: Menhaden 2 Auto Replied

Hello ASMFC,

I am a lifelong recreational fisherman who spends most of his time surfcasting. I live and fish on Long Island in NY. Over the past handful of years, I am seeing far less adult bunker than ever in my lifetime (I am 50 years old). And less juvenile bunker schools as well. Its is scary how much fewer adult bunker there is.

Based on what I've read about menhaden, I learned that menhaden being harvested in the Chesapeake would have a negative affect on the amount of bunker seen at other areas of the Atlantic coast. Having seen such a drastic and sustained drop in the amount I am seeing on Long Island, I can't help but suggest that drastic action be taken by ASMFC.

Towards that end, I would like to see Option C1E selected for the Reduction Fishery Cap. I also would like to see B1 Selected for the quota periods (spread evenly during the year). Lastly, I would like the ASMFC to be mandated to revisit this status Menhaden a minimum of every 3 years (Option B).

Thank you for taking my comments.

To the Atlantic Menhaden Management Board,

I'm an angler and Chesapeake Bay resident writing to comment on Atlantic Menhaden Draft Addendum II. I support the following measures:

1. Cutting the Chesapeake Bay Cap by the full 50%.

2. Linking the Bay Cap to the coastwide catch limit, so that when one drops, the other does too.

3. Spreading Bay harvest across quota periods so the Bay isn't stripped in spring and summer.

4. Reducing the coastwide catch limit by 40% to meet the science for 2027 and beyond.

Menhaden are the foundation of the Bay's food web, and the striped bass, bluefish, and other species that depend on them need a healthy forage base. Please adopt these measures.

Thank you for your time and consideration.

Rich Schlentz

Subject: [External] IMPORTANT!! Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

It is vital to cut the harvest of Menhaden in the Chesapeake Bay by FULL 50% and reduce the coastwide catch limit by at least 40%. It is vital to the fisheries and marine life stretching the east coast. It is the most important fishery we have and it will be the downfall of many industries that rely on these fish to thrive. When the Menhaden population drops, so does everything in the northeast. Striped Bass, Whales, Tuna, Bluefish, False Albacore, and many more spices rely on these fish as forage and cutting the harvest will ensure a healthy balance in the ecosystem. Nothing is more important on the east coast waters currently. Cut the Chesapeake Bay cap and save the east coast fishery so it can be passed down generations to come.

Thank you for your time.

Very Respectfully,

Kieran Coen

Dear Commissioners,

I am writing as a Maryland resident and recreational angler who fishes for striped bass on Chesapeake Bay and it's tributaries.

Menhaden are the foundation of the Bay's food web, and the health of the fish I pursue depends directly on how this forage fish is managed. I urge the Commission to adopt the following measures in Draft Addendum II:

1. Reduce the Chesapeake Bay Reduction Fishery Cap by the full 50%. The Bay is a critical nursery and feeding ground, and a partial cut does not go far enough to protect the predators that rely on menhaden there.

2. Link the Bay Cap to the coastwide total allowable catch, so that when the coastwide limit drops, the Bay Cap drops with it. Managing the two separately allows harvest pressure to concentrate in the Bay even as the stock declines.

3. Spread Bay harvest across quota periods. Concentrating removals in spring and summer strips the Bay of forage at exactly the time striped bass, osprey, and other predators need it most.

4. Reduce the coastwide catch limit by 40% for 2027 and beyond, consistent with the science and the ecological reference points the Commission has adopted.

Thank you for the opportunity to comment and for your work to protect this resource.

Sincerely,

Jeremy Buckler

To the Atlantic Menhaden Management Board,

I am writing to support the most conservative options in Draft Addendum II.

Please reduce the Chesapeake Bay Reduction Fishery Cap by the full 50%, link the Bay Cap to the coastwise total allowable catch (TAC), and divide the Bay Cap into quota periods so harvest isn't concentrated in the spring and summer.

I also urge the Board to set a coastwise TAC for 2027 and beyond that meets the ecological reference point target. The 2025 assessment showed the stock is smaller than previously estimated, and the Board's own projections found a cut of 50% or more was needed to meet that target.

Thank you for considering my comments.

Subject: [External] Atlantic Menhaden 2027-2028 TAC

Categories: Menhaden 2 Auto Replied

Dear ASMFC Commissioners,

I am writing to provide comments on the Atlantic Menhaden 2027–2028 TAC. The Commission must act immediately to prevent continued unsustainable harvest levels.

The coastwide TAC should be cut by 40% to approximately 112,100 metric tons for both 2027 and 2028. According to the ASMFC's own projections, even this reduced TAC still carries a 40% and 50% chance of over-harvest in those respective years. Maintaining the current TAC of 186,840 metric tons for 2027—simply due to delay—would allow another season of excessive and damaging commercial harvest.

The TAC must be set as a fixed tonnage for 2027 and 2028. It should not be tied to an automatic formula, nor deferred pending further analysis. The stock cannot afford additional years of inaction.

The Commission must implement meaningful management measures now.

Sincerely,

Robert Pellegrino

Massachusetts Recreational Angler

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear ASMFC Commissioners,

I am writing to submit my comments on Atlantic Menhaden Draft Addendum II. The Commission must take decisive action to protect the Chesapeake Bay and the broader ecosystem that depends on a sustainable menhaden population.

First, the Chesapeake Bay Reduction Fishery Cap should be fixed at 25,500 metric tons. With a coastwide quota near 112,000 metric tons, maintaining the current 51,000-ton Bay Cap would allow roughly 45% of the entire coastwide harvest to come from inside the Bay. A 25,500-ton cap represents about 23%—consistent with the 24% average since 2018—and is far more appropriate for the Bay's ecological needs.

Second, every option linking the Bay Cap to the coastwide TAC must be rejected. Reductions to the Bay Cap are conservation measures for the Bay itself and should be treated as such. Linking the Bay Cap to the coastwide TAC invites geographic reallocations of unused quota and creates a pathway for increased harvest in the future, undermining the very purpose of the cap.

The Bay's forage base, predators, and overall ecological stability depend on meaningful limits. The Commission must act now.

Sincerely,

Robert Pellegrino

Massachusetts Recreational Angler

Subject line: Atlantic Menhaden Draft Addendum II

I'm a fisherman from Milford CT and the bunker have been absent from our shoreline. The ospreys used to be fishing the harbor constantly, they are scarcely seen. The fishing for striped bass and bluefish is suffering.

We need to protect Atlantic menhaden to protect our fishery before it's decimated from lack of bait. I support efforts to Reduce the industrial commercial harvesting of menhaden, the most important fish in the sea.

To Whom it May Concern,

I'm now a recreational fisherman that previously spent time in the commercial fishing industry and hold a commercial USCG Captains License.

Our fisheries are in a free fall, water quality is deteriorating in ways we don't understand and we are seeing increased variability in species recruitment rates.

Our fisheries are worth much more recreationally than commercially. When smaller operators are favored more than industrial fisheries, more Americans benefit too.

For Addendum II

- Set the Chesapeake Bay Reduction Fishery Cap at 25,500 metric tons.
- There should be no linkage between the Bay Cap the Coastwide TAC.

We know that the statistics used for decades were seriously flawed and for once, please manage conservatively. For the fish…

Subject: [External] Menhaden Total Allowable Catch

Categories: Menhaden 2 Auto Replied

Dear ASMFC Commissioners,

My name is Thomas Fuda. I am an avid recreational angler from the state of CT. I fish the waters of the northeast, but primarily focus on the waters of west central Long Island Sound from both boat and shore. I would like to state for the record that I would like the ASFMC Menhaden board adopt a reduction of the Total Allowable Catch (TAC) for the 2027 and 2028 seasons that will result in at least a 50% probability of being at or below the fishing mortality target. Based on what I heard at a recent meeting, this requires approximately a 40% cut to the TAC from 186000 metric tons to about 115000 metric tons.

I make this comment because my own personal observations tell me we are overfishing this vital forage species. I have been on the water 60+ times a season for the past 10+ years. For the past several seasons, I have been seeing fewer and fewer schools of adult bunker in my part of Long Island Sound. I used to frequently see schools of adult bunker swimming on the surface in harbors and open waters off the CT shore. This past season, they were non-existent. And I heard this same story from all of my fishing friends that fish the same waters. This lack of bunker was matched by a corresponding lack of bluefish and striped bass this season. West central Long Island Sound is becoming a fishing dead zone.

I believe my observations are backed by recent science, produced by Gerald Ault, et al, that suggests that the natural mortality figure used in deriving the most recent stock assessments and resulting TAC, was far too high. This resulted in overly optimistic stock assessments and a coast-wide TAC that was far too high. The true “stakeholders” in this fishery are the many predator species that depend on bunker for survival. On their behalf, please make this much needed cut to the TAC in your upcoming meeting in November. Thank you for your time.

Regards,
Thomas Fuda

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Atlantic Menhaden Management Board,

I am writing in support of stronger protections for Atlantic menhaden. Keeping more menhaden in the water means more food for striped bass, bluefish, weakfish, ospreys and whales.

Please adopt the full 50% reduction in the Chesapeake Bay Reduction Fishery Cap, link the Bay Cap to the coastwide catch limit so it falls when that limit falls, and spread the Bay harvest across quota periods rather than concentrating it in spring and summer.

I also support reducing the coastwide catch limit by 40% for 2027 and beyond. Please put the long-term health of the ecosystem first and leave enough forage in the water for the species that depend on it.

Thank you for considering my comments.

Regards,
Sam Parker

Hello,

I am writing today to advocate for the reduction of the harvest limit for menhaden by at least 50% in the Chesapeake Bay. We are losing the resource.

To the Atlantic Menhaden Management Board,

I am writing to express my strong support for the most protective conservation measures outlined in Draft Addendum II.
Specifically, **I ask that you cut the Chesapeake Bay Reduction Fishery Cap by a full 50%,** tie this Bay Cap directly to the coastwide total allowable catch, and split the cap into seasonal quotas to prevent heavily concentrated harvesting during the spring and summer months.
Additionally, I strongly encourage the Board to **establish a coastwide TAC for 2027** and beyond that successfully meets the ecological reference point target.
The 2025 stock assessment demonstrated that the population is lower than previous estimates, and the Board's own forecasting indicates that a reduction of at least 50% is necessary to achieve this goal.

Thank you for your time and consideration.

Please support the following items to keep the Menhaden population strong,

1. Cutting the Chesapeake Bay Cap by a FULL 50%

2. Linking the Bay Cap to the coastwise catch limit, so when one drops, the other does too.

3. Spreading Bay harvest across quota periods so the Bay isn't stripped in spring and summer.

4. REDUCING THE COASTWIDE CATCH LIMIT BY 40% to meet the science for 2027 and beyond.

Thank you for your time and attention to this matter.

Subject: [External] Atlantic Menhaden 2027-2028 TAC

Categories: Menhaden 2 Auto Replied

Dear Atlantic Menhaden Management Board,

I am Christopher Gonzalez, owner and captain of Capt Gonzo Charters in Brick, New Jersey. This comment is only on the 2027–2028 coastwide total allowable catch. I am submitting it separately from my Draft Addendum II comment.

Please cut the coastwide TAC by 40 percent, to about 112,100 metric tons, and set it as a fixed tonnage for 2027 and 2028. Do not defer the cut, and do not use a formula that can float the quota back up.

ASMFC's own projections show the current 186,840 metric ton TAC has about a 99.5 percent chance of exceeding the ecological reference point fishing-mortality target each year from 2027 through 2029. The last 20 percent cut was mostly unused quota. It did not leave more fish in the water. This one has to be real.

Menhaden are the forage base for the stripers, bluefish, tuna, and whales my charters depend on from Barnegat Bay to the offshore grounds. Please manage them for the ecosystem, not just for reduction in harvest.

Respectfully,

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear Atlantic Menhaden Management Board,

My name is Christopher Gonzalez. I run Capt Gonzo Charters out of Brick, New Jersey, on Barnegat Bay and out of Manasquan Inlet. I hold a Merchant Mariner Credential and fish these waters personally, inshore and offshore, on a 2021 Sailfish 320CC. I have been fishing since I was six and worked charter and party boats out of City Island and Sheepshead Bay from the time I was twelve.

I am writing in support of leaving more Atlantic menhaden in the ocean for striped bass, bluefish, tuna, whales, osprey, and everything else that depends on them.

Bunker are the engine of the fishery I make a living on. When the schools are thick, the bay and the inlet come alive. When they are thin, the striper bite fades, the bluefish scatter, and the birds and whales move on. My clients come to New Jersey to see that food chain working. A day of watching whales on bunker, then catching the fish that are eating them, is what keeps a small charter business booked.

Please adopt the strongest reduction on the table for the Chesapeake Bay Reduction Fishery Cap: Option B4, a one-time 50 percent cut from 51,000 metric tons to 25,500 metric tons. Set that as a fixed cap. Do not link it to the coastwide TAC in a way that lets the Bay harvest rise again if the coastwide quota is later increased. A Bay reduction should stay a Bay reduction.

I also support splitting the cap into seasonal quota periods so the reduction fleet cannot stack the harvest into the spring and summer, when predators, pound-net watermen, and the nursery are using the same fish.

The coastwide stock may not be declared overfished, but localized availability is what my season runs on. Concentrating industrial reduction harvest in the Chesapeake during the warm months is the wrong place to keep pulling the base of the food web. Striped bass are still rebuilding. Osprey productivity in the Bay has been a concern. Whales and tuna follow the same bait. Leaving more menhaden in the water is the practical move.

Thank you for taking comment from a working captain, not just the reduction industry.

Respectfully,

Subject: [External] Atlantic Menhaden Draft Addendum II

Categories: Menhaden 2 Auto Replied

Dear ASMFC,

My name is Nicolas Theunissen and I am a PhD candidate at Yale University as well as a passionate recreational fisherman here in the northeast. I am writing to support the Atlantic Menhaden Draft Addendum II cut the Chesapeake Bay Cap by 50%, link the Bay Cap to the coastwide catch limit, spread the bay harvest over quota periods, and reduce the coastwide catch limit by 40% to meet with the results of stock assessments.

As a passionate angler I have noticed a significant decline in the number of both adult and juvenile menhaden in recent years, which are critical to the stocks of game fish that I target such as bluefin tuna, striped bass, bluefish, weakfish and many more. I believe this resource needs to be managed with the best interest of the whole fishing community in mind, including commercial and recreational anglers who target species that predate on menhaden.

Thank you!
Best,
Nicolas Theunissen

ASMFC Draft letter #1

Dear Members of the Atlantic States Marine Fisheries Commission (ASMFC):

I am writing as a Maryland resident who has lived in St. Mary's County since 2005 and has developed a deep personal connection to the Chesapeake Bay. I am an avid conservationist, experienced environmental litigator and someone who spends considerable time on and around the Bay. I am also deeply interested in the wildlife that depends upon this remarkable ecosystem, particularly osprey, striped bass, sharks, whales, and other species whose survival is tied directly or indirectly to a healthy forage base.

I strongly support a 50 percent reduction in the Chesapeake Bay reduction-fishery cap, from 51,000 metric tons to 25,500 metric tons annually. I also strongly support establishing seasonal quota periods for menhaden so that harvest is distributed throughout the year rather than concentrated in an intense summer fishing window.

The Chesapeake Bay is facing an ecological crisis that should not be minimized or postponed. Declining productivity, widespread osprey nest failures, and continued concerns about the condition of the striped bass population are warning signs that demand a precautionary approach to the management of one of the Bay's most important forage fish - **menhaden.**

Menhaden are not merely another commercial commodity. They are a foundational component of the Chesapeake Bay food web. They provide critical forage for striped bass, osprey, bluefish, weakfish, dolphins, and numerous other predators. Removing very large quantities of menhaden from the Bay during the period when they are most concentrated and most biologically important deserves particularly careful scrutiny.

The scale and timing of the reduction fishery are especially troubling. More than 100 million pounds of menhaden can be removed under the existing Chesapeake Bay reduction-fishery cap. When that harvest is concentrated into a relatively short summer period, the ecological effect is not simply a matter of the annual tonnage. **Where and when the fish are removed matters.**

An intense summer harvest can create localized depletion at precisely the time when menhaden are serving as forage for other species. It also potentially deprives recreational anglers, commercial watermen, charter operators, and the broader coastal tourism economy of access to a shared public resource. These competing interests deserve meaningful consideration in the management process.

I am particularly concerned about allowing an annual quota to be treated as though the timing of harvest is irrelevant. It is not. A fish removed from the Bay in June is not ecologically equivalent to that same fish being harvested months later. The Bay's predators have seasonal feeding requirements, and the availability of forage during critical periods can matter greatly to their survival and reproductive success.

For that reason, I urge the Commission to establish **strict seasonal quota periods that distribute the allowable harvest more evenly throughout the year and prevent the reduction fishery from concentrating an extraordinary volume of harvest into the summer months**.

Seasonal management would provide a more precautionary approach and would better recognize the fact that Chesapeake Bay is a dynamic ecosystem rather than simply another geographic allocation within a coast-wide fishery.

There is also an important management issue that deserves attention. The Commission's coast-wide menhaden assessment does not provide the same level of quantitative information about menhaden abundance and availability specifically within Chesapeake Bay. That uncertainty argues for caution—not for assuming that the Bay can safely sustain the maximum allowable harvest.

The Chesapeake Bay belongs to all of us. It belongs to the watermen who have made their living here, the recreational fishermen who pursue its species, the sailors and boaters who enjoy its waters, the communities whose economies depend upon it, and the wildlife that has no voice in these proceedings. Menhaden management should reflect that broader public interest.

I respectfully urge the Commission to:

1. Reduce the Chesapeake Bay reduction-fishery cap by 50 percent, from 51,000 metric tons to 25,500 metric tons per year.

2. Establish firm seasonal quota periods for menhaden.

3. **Prevent excessive concentration of reduction harvest during the summer months.

4. Apply a precautionary approach in light of ecological uncertainty and the importance of menhaden as forage.

5. Give meaningful consideration to the needs of striped bass, osprey, other predators, recreational anglers, watermen, charter operators, and the Bay's broader tourism economy.

I have spent years watching, enjoying, and caring about the Chesapeake Bay. I have seen firsthand what makes this ecosystem extraordinary, and I am increasingly concerned about the signs that its productivity and resilience are being strained.

We should not wait until the consequences are unmistakable before acting.

The prudent course is to reduce the intensity of the reduction fishery now, protect menhaden as a critical forage resource, and distribute harvest in a manner that gives the Chesapeake Bay ecosystem a better opportunity to sustain the wildlife and fisheries that depend upon it.

Thank you for your consideration and for your responsibility to future generations of Chesapeake Bay users and stewards.

Sincerely,

Suellen Keiner
St. Mary’s County, Maryland

Public Comment in Strong Support of a 50% Chesapeake Bay Cap Reduction and Seasonal Quota Distribution in Draft Addendum II to Amendment 3

Commenter: Jeremy Schreifels, PhD

I am writing in strong support of the most protective measures under consideration in Draft Addendum II to Amendment 3 of the Interstate Fishery Management Plan for Atlantic Menhaden. I urge the Atlantic Menhaden Management Board to cut the Chesapeake Bay reduction-fishery cap by 50% and to spread that harvest across the season with seasonal quota periods.

I also urge the Board to go further: require real monitoring and public reporting of the reduction fishery, restrict purse-seine fishing in sensitive areas and at sensitive times, and limit the use of spotter aircraft that help the fleet find and empty out schools of fish.

As a homeowner on the Severn River, I've watched the Bay's fish and bird life change from my own backyard. My observations aren't a substitute for scientific monitoring, but they line up with a growing body of research documenting real food-web and reproductive problems in parts of the Chesapeake Bay.

Requested management actions

I respectfully ask the Atlantic Menhaden Management Board to adopt the following:

1. Cut the Chesapeake Bay cap by 50%

Reduce the current 51,000-metric-ton cap to 25,500 metric tons a year (or lower). This is the most protective option in Draft Addendum II, and it's the level ASMFC's own 2025 assessment says is needed to meaningfully reduce the odds that fishing mortality stays too high. [1,2]

2. Split the cap into three seasonal quota periods

Spread the reduced cap across three periods so the fleet can't take it all in one spring-and-summer push — exactly when Bay predators need menhaden most. This option is already on the table in Draft Addendum II and directly addresses ASMFC's own concern about concentrated fishing effort. [1]

3. Require real electronic monitoring and public reporting

Every reduction-fishery vessel operating in the Bay should report electronically, not just through weekly landings totals. At minimum, the system should include:

- electronic, trip-level reporting of catch, effort, date, time, location, and vessel identification for every landing in the Bay

- vessel monitoring systems (VMS) or equivalent electronic location tracking on all reduction-fishery vessels
- real-time or near-real-time quota accounting as the Bay cap is approached, with automatic closure before it's exceeded
- independent auditing of landings and compliance
- public reporting, both ongoing aggregate data and a public annual report on compliance, quota use, fishing locations, effort, and bycatch

The 2019 cap violation, discussed below, shows why this matters: a cap nobody can verify in real time isn't a real limit.

4. Add stronger time and area protections

Establish closures or other protections for menhaden during critical periods and in areas important for spawning, nursery habitat, and predator feeding. This is consistent with the precautionary options the Chesapeake Bay Work Group has already considered. [3]

5. Restrict purse-seine fishing in ecologically sensitive areas

Limit purse-seine operations in tributaries and other areas where concentrated harvest could strip a local area of menhaden or interfere with predators feeding there.

6. Restrict or prohibit spotter aircraft and drones in the Bay

Spotter planes and drones make it far easier for the fleet to find and quickly harvest concentrated schools of fish. That capability deserves real limits inside a confined system like the Chesapeake Bay.

7. Improve location-specific monitoring and assessment

Fund and require better data on menhaden abundance, catch, effort, and predator interactions at the Bay and tributary scale. ASMFC already identifies better fine-scale data and models as a research priority. [1]

Why these measures are needed

Based on the scientific literature, ASMFC's analyses, and what I've observed, the following evidence supports my requested management actions:

1. Menhaden are a key foundation for the Chesapeake Bay food web

Atlantic menhaden aren't just another commercially caught fish, they're a forage species, meaning much of what they eat gets passed up the food chain when bigger fish, birds, and other

predators eat them. NOAA Fisheries describes menhaden as an important prey species and highlights their role in the Chesapeake Bay ecosystem. [1]

Menhaden also link the Atlantic Ocean to the Bay through their life cycle: they spawn offshore, their larvae drift into estuaries like the Chesapeake to grow up, and the juveniles eventually head back out to coastal waters. [1] The Bay has long been an important nursery for menhaden, and research shows it contributes substantially to the coastwide population. [2,3]

Because menhaden are such important prey here, removing large numbers from one area of the Bay during the season when predators depend on them has consequences that go well beyond the fish that were caught.

2. Menhaden abundance has remained low compared with historical levels

The long-term record backs up the case for greater caution. A peer-reviewed analysis of six decades of Atlantic menhaden data found that abundance remains well below the highs of the 1970s and '80s, and that recruitment (i.e., the number of young fish surviving to join the population) has stayed unusually low in the Bay. The study flagged that persistent low recruitment as a real concern for managers trying to sustain both the fishery and menhaden's role as forage for other species. [4]

3. The osprey population is suffering

Recent research led by Bryan Watts and colleagues at the Center for Conservation Biology at William & Mary, working with the U.S. Geological Survey and other institutions, provides strong evidence of widespread reproductive problems in Chesapeake Bay ospreys.

A 2026 peer-reviewed study monitored 571 osprey nests across the Bay during the 2024 breeding season. Nests in high-salinity areas produced far fewer surviving young than nests in low-salinity areas. The produced so few, in fact, that every high-salinity area studied was losing ospreys faster than it was producing them, while low-salinity areas were producing a surplus. The researchers concluded that reduced menhaden availability is a primary driver of the poor reproduction in high-salinity waters. [5]

Earlier research in the lower Bay documented a long-term decline in how much food ospreys were bringing to their nests and in their reproductive success, tied to swings in menhaden availability. [6] The long-term numbers are troubling: in Mobjack Bay, the rate at which menhaden were delivered to osprey nests dropped by more than 80% over the study period. Because menhaden are unusually calorie-dense compared to other fish, that shift cut the overall energy value of the osprey diet by roughly half. [6]

We're seeing reduced food availability and reproductive failure right now, in a highly visible, fish-dependent predator. I've tracked osprey nests along the Severn River near my home. In 2024, two of four monitored nests failed. In 2025, two of three failed. In 2026, only two pairs returned to these sites. I know this is a small sample that can't establish cause on its own. I offer

it as a local observation consistent with the much broader scientific evidence of food stress and reproductive problems now being documented across parts of the Bay.

The Commission shouldn't wait until local populations have declined past the point of recovery before acting.

4. A coastwide "healthy" stock does not resolve the problem in the Chesapeake Bay

ASMFC's current assessment doesn't classify Atlantic menhaden as overfished or experiencing overfishing coastwide. [7] But that doesn't answer the question in front of the Board. ASMFC itself acknowledges that its current models can't produce a stock status or harvest advice for a smaller region like the Chesapeake Bay separately from the ocean as a whole. [1]

The real question for the Bay is: is there enough menhaden in the Bay to support the Bay's ecology? ASMFC's own Chesapeake Bay Work Group couldn't answer that question. It still identified changes in menhaden availability, predator needs, and the timing of the Bay fishery as reasons to consider additional precautionary management. [3]

That uncertainty is a strong argument for caution, not for leaning on a coastwide average that wasn't designed to answer this question.

5. The 2019 cap violation demonstrates the need for stronger monitoring and enforcement

The history of the Bay cap itself shows why stronger monitoring and public reporting matter. ASMFC established the current 51,000-metric-ton Chesapeake Bay reduction-fishery cap under Amendment 3 in 2017. [1] Virginia hadn't yet written the new cap into its own regulations when, in September 2019, Omega Protein notified ASMFC that it intended to exceed it. ASMFC records show Virginia had been monitoring landings and had already told Omega Protein to stay under the cap. [8]

Omega Protein exceeded it anyway. At its October 2019 meeting, the ASMFC Atlantic Menhaden Management Board reported that the reduction fishery had blown past the 51,000-metric-ton cap on September 6, with Bay landings about 27% over the limit (reaching roughly 65,000 metric tons). [8]

This episode matters for two reasons. First, a cap nobody is actually watching isn't much of a conservation measure. Second, the public still has very little access to the location and operational data needed to independently check how the reduction fishery is affecting the Bay.

ASMFC reports that it currently relies on state and federal partners for monitoring and that Bay landings are reported weekly. [1] Weekly landing totals are a poor substitute for the real electronic monitoring described above.

6. ASMFC's Ecological Reference Points (ERPs) support a substantial reduction

There's another reason to support a 50% reduction: it's what ASMFC's own numbers point to. The Commission's 2025 assessment found that Atlantic menhaden fishing mortality was above the Ecological Reference Point (ERP) target and that fecundity (i.e., the population's egg-producing capacity) was below its ERP target. [9]

In response, the Board cut the 2026 coastwide Total Allowable Catch from 233,550 metric tons to 186,840 metric tons, a 20% reduction. That gets fishing mortality to a zero percent chance of exceeding the ERP threshold, but it still leaves a 100% chance that fishing mortality stays somewhere between the ERP target and the threshold, rather than getting back down to the target itself. [2, 9] Most importantly, ASMFC's own analysis states plainly: "[t]o have a lower probability of being at or above the ERP F target, a 50% or more reduction in the TAC would be required." [2]

A 50% reduction isn't an arbitrary ask. It's the number ASMFC's own technical analysis says is needed to meaningfully reduce the odds that fishing mortality stays at or above a target the stock is not currently meeting.

7. Concentrated harvest is a different problem from coastwide harvest

Fishing pressure isn't spread evenly across a species' range, and its effects aren't either. The Chesapeake Bay cap exists in the first place because of concerns about localized depletion. ASMFC set the original cap in 2006 as a precaution against exactly that. [1] Draft Addendum II raises the same concern again: the Board is looking at cutting the cap by up to 50% and spreading it across three quota periods because reduction-fishery effort has been concentrating in spring and summer, with knock-on effects for other fisheries and the ecosystem. [1]

A school of menhaden pulled out of one tributary isn't available to the osprey, striped bass, or bluefish hunting in that tributary just because plenty of menhaden exist somewhere else, hundreds of miles away. Menhaden's value to the ecosystem depends on where and when they are, not just how many exist coastwide.

Spring and summer matter more than other seasons for this reason. That's when fish and birds need extra energy for growth, migration, breeding, and raising young. Osprey research shows what happens when enough high-energy forage isn't there during the breeding season. [5-6, 11] A single annual quota gives the fleet every incentive to harvest heavily whenever menhaden are most concentrated and easiest to catch, which is often exactly when localized depletion does the most ecological damage. Splitting the cap across three periods spreads that pressure out over the year, so predators aren't left short during the months they need menhaden most.

That's why I support both the 50% cap reduction and the seasonal quota periods.

8. Purse-seine fishing creates additional ecosystem concerns

The Board should also weigh how menhaden are caught, not just how many. Purse seines are extremely efficient at capturing schooling fish, and when paired with spotter aircraft that can locate schools from the air, they let a fleet remove large quantities of fish very quickly from a small area. I'm not arguing purse seines are inherently wrong for catching menhaden, I'm arguing that using them in a confined, ecologically complex estuary like the Chesapeake Bay calls for more caution than using them far offshore.

9. Environmental conditions can concentrate fishing effort

How environmental conditions interact with purse-seine fishing also matters. Langseth and colleagues studied the Gulf menhaden fishery and found that as dissolved oxygen dropped, both menhaden and the fishing fleet shifted toward particular areas, changing where fish could be caught and how easily. [12]

Environmental conditions can change where menhaden gather and where fishing effort follows them. The Bay already sees real variation in oxygen levels, salinity, and temperature across its waters and through the year. Combine that with highly efficient fishing gear, and it's worth watching closely where and when industrial harvest is actually happening.

10. Spotter aircraft and drones should be addressed

I also urge ASMFC and the states to look at restricting spotter aircraft and drones in the Bay. Aircraft dramatically improve the reduction fleet's ability to find dense schools of menhaden, and in a confined system like the Chesapeake, that makes rapid, highly localized removal much easier. Restricting or banning aircraft-assisted purse-seine fishing in the Bay would blunt the fleet's ability to quickly find and empty out isolated concentrations of fish. It also fits the same precautionary logic that led ASMFC to set the Bay cap in the first place.

11. The Commission has already recognized the need for precaution

The strongest argument for precaution is that the Commission has already recognized the problem itself. The Bay cap exists because of concerns about localized depletion. [1] In 2024, ASMFC responded to concerns about menhaden fishing's effects on ospreys by asking USGS scientists for data on osprey abundance, distribution, and diet, and then formed a Work Group to evaluate precautionary options. [3] That Work Group went on to consider time and area restrictions meant to protect fish-eating birds and fish during critical parts of their life cycles. [3] Draft Addendum II now proposes cutting the Bay cap by up to 50% and spreading it across quota periods. [1]

None of this means the Commission has failed to see the problem. It means the opposite: the Commission recognizes that current management may not adequately protect against localized harm. The right response is to act on that recognition.

Conclusion

None of this depends on claiming the entire Atlantic menhaden population is collapsing, or that menhaden are endangered. The case is narrower than that. Menhaden are a foundational forage species, the Chesapeake Bay is one of their most important nurseries, and multiple independent lines of evidence, including juvenile abundance, osprey reproduction, ASMFC's own uncertainty about Bay-specific stock status, the 2019 cap violation, and the Commission's own ERP analysis, all point the same direction.

The question in front of the Board isn't whether we can prove continued harvest will cause ecological collapse. It's whether we have enough information to justify continuing to remove large quantities of a foundational forage species from a confined, ecologically important estuary, when the Commission itself acknowledges real uncertainty about the Bay's local stock status and ecological needs. The short and clear answer is: we don't.

The cost of precaution is a smaller industrial harvest. The cost of not being precautious could be a depleted forage base, struggling predator populations, and a Chesapeake Bay food web in worse shape than the one we have now. I urge the Board to choose precaution:

- cut the Bay cap by 50%,
- spread it across three seasonal quota periods,
- require real monitoring and public reporting, and
- move forward on the additional time, area, and gear restrictions described above.

Open-Ended Comments from the Survey

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Pamela Dorgan	Connecticut	Concerned stakeholder		I support Connecticut Audubon supporters and request a 50 percent reduction in the Bay Cap, with option B2 for how the catch is distributed in amounts across time.
Tripp Dixon	Connecticut	Private recreational angler		It is both unconscionable and unsustainable to allow the continued overfishing of the Chesapeake Bay. We need to be much better stewards of our waters — protecting ospreys, coastal wildlife, and the future of recreational fishing.
Sandy Newton	Connecticut	Other (please specify)	Osprey monitor for CT Audubon	50% reduction in the Bay Cap would be preferred as recommended by CT Audubon
Ashley Kishorn	Connecticut	Other (please specify)	Coastal resident	A 50% reduction in Bay Cap is necessary to ensure healthy populations of Osprey in our future.
Renee Sonnenblick	Connecticut	Concerned stakeholder		A cap on mehadrin needs to be set to save the osprey.
Tim Carey	Connecticut	Private recreational angler		A large reduction coastwide should be implemented. The reduction fishery is especially harmful because they take such a large number of fish out of the ecosystem all at once. A large reduction should help the biomass rebound faster and could then lead to raising quotas sooner. Being aggressive now will only help the future situation, why slowly make changes to growing such an important forage species that effects almost every animal near the ocean. Be aggressive and stand up to these giant corporations. Don't let their profit hurt the tax paying people and future generations of people that enjoy all aspects of the oceans

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Thomas Fuda	Connecticut	Private recreational angler		A recently released study by Jeralt Ault and Jiangang Luo (https://www.sciencedirect.com/science/article/pii/S0165783626002183) indicates that recent menhaden stock assessments used what looks like an erroneously high estimate of natural mortality, which subsequently led to overly optimistic estimates of the menhaden biomass and the level of fishing mortality it could sustain. That being said, I believe the findings of this study warrant precautionary management of both the bay cap, and the coast-wide TAC. I think this new information justifies the 50% cut in the bay cap as well as an additional 30% cut to the TAC on top of the 20% cut that was already taken in 2026. Lobbyists from the reduction fishery argue that we should wait for the results of the VIMS study to determine whether or not localized depletion is occurring in the Chesapeake. I would argue the opposite. Absent science that tells us the bay can tolerate removal of 51000 metric tons of menhaden, I think more precautionary management is required. The ecological and economic impact of removing too many menhaden is far more significant than the economic impact to the reduction fishery if we constrain harvests in the Chesapeake.
Whitney Gutgsell	Connecticut	Concerned stakeholder		According to the data collected by the CT Audubon this year there is "growing concern that Osprey populations along the Eastern seaboard are declining due to a lack of food, Connecticut Audubon is urging the ASMFC to reduce the fishery cap by 50%, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Osprey, are not put in even greater jeopardy". Osprey are an indicator species of the health of our coastal ecosystems and fish stocks. We must protect our stocks, our osprey populations, and our fisheries with careful stewardship. Thank you.
Barbara Harman	Connecticut	Concerned stakeholder		Act now while remaining open to stricter measures.
Robert	Connecticut	Private recreational angler		All the predatory species of fish up in the New England area have been smaller size because of the loss of menhaden in our areas. The fish have nothing to feed on as far as bait species.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Douglas Van Tornhout	Connecticut	Other (please specify)	Advocate for Osprey and other wildlife	Annual review would be appropriate with changes made as necessary recognizing changes in menhaden population
William Root	Connecticut	Concerned stakeholder		Apart from our primary concern about protecting menhaden populations and other aquatic species that are dependent upon them. I am extremely worried about the recent downward trend in population of osprey along the New England coastline. This is a bird that all of us worked very hard to aid in its recovery from earlier pesticide pollution problems, and now it is threatened once again. I strongly favor protecting and encouraging the growth of the Menhaden population as it is the primary fish source in our area for the osprey. Thanks for your consideration and protecting our Native wildlife species.
Stephen Marsi	Connecticut	Concerned stakeholder		As a concerned citizen of Connecticut, I strongly recommend the full 50 percent Bay cap reduction, tied to the coastwide limit and split across three seasons under Option B2's 25/25/50 allocation, so that the fewest menhaden would be removed during Osprey nesting season. Thank you.
Thomas Mariconda	Connecticut	Concerned stakeholder		As a person of faith and I am a sincere person of faith, a retired ordained Deacon in the Episcopal Church in Connecticut and a member of the Third Order of Saint Francis (Episcopal). I believe that we all are called to be care for creation. It is my understanding that the The Atlantic States Marine Fisheries Commission is considering changes to the amount of menhaden that can be harvested from the Chesapeake Bay. As a person of faith, I am urging the commission to reduce the fishery cap by 50 percent, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Ospreys, are not put in even greater jeopardy.Last year Connecticut Audubon's Osprey Nation recorded its lowest breeding success since the statewide community science program launched in 2014 to monitor the birds. This year is looking even worse. Osprey and other species that rely on menhaden do not have years longer to wait. Decisive action is needed now. I ask you to support this change in order to protect creation.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
CJ Stelzel	Connecticut	Other (please specify)	Osprey Steward with CT Audubon Society's Osprey Nation	As a steward with CT Audubon Society's Osprey Nation, I am a strong supporter of drastically reducing the menhaden harvest. This year I witnessed several previously very productive nesting osprey pairs abandon their nests, and had the gut-wrenching experience of watching chicks starve to death or just completely disappear between visits. From my main nests, there was just one single fledgling, whereas during the prior three years the nests produced 4-5 fledglings total each year. The data from CT Audubon and up and down the Atlantic seaboard is clear - there is a crisis and that crisis requires action. It is my hope that the ASMFC heads these warning signs and chooses to curtail the menhaden harvest. Not just for benefit of the osprey, but for all of the other species in the chain that we don't have the data for. Please don't wait until it's too late to turn things around just to help corporations make more money now.
Denese Deeds	Connecticut			As a supporter of wildlife and the Ospreys particularly, I urge you to reduce the fishery cap by 50% to assure that menhaden, which are essential for the health of the Osprey are not put in further jeopardy.
William C Chantrell	Connecticut	Concerned stakeholder		As a volunteer Osprey Nation volunteer for the Audubon Society in Connecticut, I have personally witnessed a dramatic reduction in successful osprey nests over the past two years. It seems this is a direct result of the reduction of their primary food source, Menhaden. I urge the Commission to do everything it can to reduce fishing pressure on Menhaden before it is too late! Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jessica L. Esposito-Halka	Connecticut	Other (please specify)	Wildlife Ecologist	As a wildlife ecologist with more than a decade of experience in wildlife conservation, including work as a shorebird biologist with Audubon Connecticut and as a wildlife ecologist contracted with CT DEEP, I have witnessed firsthand concerning declines in menhaden availability and coastal bird reproductive productivity over the past few years. Research in the Chesapeake Bay has demonstrated that food limitation directly affects Osprey reproductive success, with supplemental menhaden significantly improving nesting productivity (Academia & Watts, 2023). Subsequent research identified reduced menhaden availability as a likely primary driver of widespread reproductive declines (Watts et al., 2026). Here in Connecticut, the 2026 Osprey Nation monitoring program documented its lowest reproductive productivity in 13 years, with growing concerns about inadequate prey (menhaden) availability (Connecticut Audubon Society, 2026). Atlantic menhaden are a foundational forage species whose ecological importance extends far beyond their commercial value. Coastwide stock sustainability does not necessarily ensure adequate local prey availability, particularly during critical nesting and chick-rearing periods. These findings underscore the need for precautionary, ecosystem-based fisheries management that recognizes the importance of menhaden to dependent wildlife and the health of our coastal ecosystems. I strongly support meaningful reductions in menhaden harvest and the adoption of the most protective measures under Draft Addendum II. References: Academia, M.H., & Watts, B.D. (2023). Food supplementation increases reproductive performance of ospreys in the lower Chesapeake Bay. Frontiers in Marine Science. [https://doi.org/10.3389/fmars.2023.1172787] Watts, B.D., et al. (2026). Widespread reproductive deficits in Chesapeake Bay ospreys. Frontiers in Marine Science. [https://doi.org/10.3389/fmars.2026.1685158] Connecticut Audubon Society (2026). Osprey Nation Sees Worst Breeding Success and More Record Lows in 2026. [https://ctaudubon.org/news/an-unmistakable-warning-sign-osprey-nation-sees-worst-breeding-success-and-more-record-lows-in-2026/]

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
KENNETH A MIKE	Connecticut	Private recreational angler		As you know the bunker has almost been eliminated in the CT area. For the first time in 33 years no striped bass were weighed in at a tournament that I attend. Many of our fishermen usually catch a few bunker keep them alive then use them for bait. Those fisherman have not caught ANY bunker this year. I feel that the commercial harvest of bunker should be stopped until the fishery recovers. This is killing the charter fishermen and the recreational fishing in our area.
Sue Wennerberg	Connecticut	Other (please specify)	Concerned citizen	Concerned that exacting new measures are put into place to increase the menhaden , thus bettering the chances of survival for the osprey . The preceding info was hard to follow.
Stephen C Mayo	Connecticut	Concerned stakeholder		Current policies are damaging Osprey populations. Osprey nestlings starved during the 2026 breeding season. Objective evidence is available from breeding census data, Osprey Nation, HawkCount, and other sources
Mark Olesnevich	Connecticut	Private recreational angler		Cut
Irene Scheibner	Connecticut	Concerned stakeholder		Decisive action is needed now - osprey and other species should not STARVE due to our encroachment. Thank you
Donna Summers	Connecticut	Other (please specify)	marine scientist and birder	Examine other potential contributors to reduced osprey breeding success where they winter, on their migration routes etc to ascertain different biological and other stressors that may contribute other than AM alleged overfishing. Implement balanced strategies to improve breeding success with these data and adjust AM fishing as needed so that not fixing osprey problem on backs of fishermen.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Scott Burns	Connecticut	Concerned stakeholder		First, I would like to congratulate the ASMFC for soliciting public input on this issue, but more importantly acknowledging its existence and seeking genuine solutions to the problem. As a lifelong Connecticut resident, with a majority of my time spent within direct view of Long Island Sound, it is heartbreaking not to see the annual boils of bunker (as I learned the name growing up). Bluefish are virtually non-existent in the Sound now, a situation with multiple underlying factors, but the decrease in bunker is among them. The ecological but also economic impact is significant. The WICC annual bluefish contest was celebrated across the Sound, and bait shops and others profited from the activity. More recently, we have learned of the struggles of osprey, particularly those along the Sound. The loss of menhaden is a direct factor in the struggles of the osprey to reproduce. Considering the time and effort spent to help restore the species, it would be tragic (and a waste of funds) to allow that progress to recede because of the loss of menhaden. While porgy (aka scup or sea bream) have seemingly replaced the bunker, the loss of biodiversity among fish cannot be overlooked, and the osprey struggle without the presence of menhaden. Fisheries are obviously a difficult industry. Connecticut has very few lobstermen at all any more, in contrast to thriving, local industry a generation ago. But if these constraints can allow the menhaden to rebound in the Chesapeake Bay and those same fisheries to acclimate economically, then this could be a win-win for both the economy and nature.
Travis	Connecticut	Private recreational angler		Fish need are help

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Sally A Ferris	Connecticut	Concerned stakeholder		For years, I have observed ospreys fishing off the Connecticut coastline. Five or six years ago, it was normal to see 6 or more ospreys diving, successfully fishing, and carrying their catch back to their nests on a daily basis. I naively thought that "ospreys always get their fish". In recent years, I have noticed a significant fall-off in successful osprey fishing activity. The summer of 2026 was particularly troubling. Throughout this past season, I saw fewer than a dozen ospreys (in total) successfully fish and carry their catch back to the nest. My anecdotal observations are confirmed by the Connecticut Audubon Society's findings that the 2026 season was the worst breeding season ever for ospreys. They confirmed for the first time that starvation may be a major factor. I urge the Atlantic States Marine Fisheries Commission to enact a 50 percent reduction in the Bay Cap on Menhaden. Thank you for your consideration.
George Finley	Connecticut	Private recreational angler		Get your act together!
Christina Schoen	Connecticut	Other (please specify)	Former scientist who appreciates biodiversity	Human consumption and habitat destruction are slowly killing off specie numbers and diversity. A long term plan for preservation is needed.
Robin Hogen	Connecticut	Concerned stakeholder		I am a "nest observer" for the CT Audubon Society and have been alarmed by the declining population of these incredible birds along Long Island Sound. Please reduce the commercial fishing of their primary source of food so they can thrive once again.
Jonathan Comerford	Connecticut	Private recreational angler		I am a fisherman who has been seeing this decline and how it's impacting or fishery's and wildlife. We need to protect the ecosystem.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Colleen Lord	Connecticut	Concerned stakeholder		I am an osprey nest monitor in CT with 5 nests and financially support the Audubon's osprey decline study. Only in 2 out of 30 observation visits was an osprey seen with a fish in 2026. Of 5 nests, 3 were active and only 1 fledgling total. Last year there were fish brought to these same nests observed at least 25 out of 30 visits. There were 7 fledged. It is heartbreaking to see the hatchlings apparently starving and dying. Osprey have been the canary in the coal mine regarding DDT in the past. I worry that they are now pointing us to another possible environmental disaster. I live on Long Island Sound and all the recreational fisherman I know have complained all summer that the bunker population appears greatly declined.
Patricia Brune	Connecticut	Concerned stakeholder		I am an osprey steward for the Connecticut Audubon Society. I and other stewards observe osprey nests throughout the summer. I have firsthand knowledge that the Connecticut shoreline suffered an inordinate amount of failed nests and nestling mortalities this summer. We volunteers have observed chicks starving to death, being culled by their parents, and in many cases parents abandoning the nests due to lack of Atlantic menhaden, their primary food source. We have learned that the osprey crisis along the entire eastern seaboard is due to commercial overharvesting in the Chesapeake Bay. I, and other stewards, implore the Commission to take steps to curtail these practices. Levels of human-caused osprey death have not been seen at these levels since the era before DDT was banned.
Jane Kinkead	Connecticut	Concerned stakeholder		I am concerned about the decline in the Osprey population and the nest failures this past breeding season. We need to manage the Menhaden population to sustain their population and to help other species who depend on them for survival.
Sandy Tosi	Connecticut	Concerned stakeholder		I am concerned about the decline in the osprey population. It has been shown that their reproductive failure is due, in part, to the lack of food. We need to ensure the survival of this species by leaving enough fish for them.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Lauren Gorham	Connecticut	Concerned stakeholder		I am not a commercial fisherman so I cannot speak to the specifics of how much or when to harvest menhaden. I can, however, see with horror dead Osprey chicks. The birds do not have the food they need to feed their babies and so they die. Menhaden are being overfished and it is crucial to the survival of Osprey, Whales and other wildlife that limits be implemented immediately. Please limit the menhaden catch along the Atlantic seaboard to 50% of the current amounts, permanently for all states. Thank you!
Michael Burns	Connecticut	Private recreational angler		I am on the water in Long Island and Block Island Sound quite often. It has been years since I have seen menhaden. They sed to be plentyfull. All to make food for salmon farming and pet food.
Jessica F.	Connecticut	Private recreational angler		I am perhaps a more active and more educated fisherman. Still I find that the amount of expertise required to answer some of these public questions leaves me thinking the point of public questions is only to be used as a shield for decisions you want to make. Assuming that is not your goal, please try to make the goals/priorities of each option more apparent for public questions.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
			fishes here in Ct and we know lots of boat captains worried about the drop in menhaden numbers. We live on the CT River and have also noticed a dramatic drop in numbers of ospreys. Where we used to get between 20 and 30 fledgelings from our 24 or so nesting pairs, this year the number is 5.	
Claire Griffin	Connecticut	Other (please specify)		I answered the questions where I felt qualified to give an opinion. for the rest, I defer to the hardworking fishing captains who depend on the sea and enthusiastic sport fishermen for their livelihoods. Once again, I'm grateful to the fisheries commission for considering this important question that affects so many wildlife species.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Hope Ropke	Connecticut	Concerned stakeholder		I believe a 50% reduction is needed to allow the menhaden population to recover. Revisit in 3 years and increase or decrease the restrictions depending on the data.
Elizabeth Coolidge	Connecticut	Concerned stakeholder		I do not know how to address the overages and underages, or how often to revisit the Bay Cap. However, I do know that ospreys need help NOW, and they desperately need more menhaden available to them since that is their primary (if not only) food source. I have been monitoring osprey nests here in Connecticut for years -- this year I monitored four nests. Usually at least three of the nests produce at least two fledglings. This year only one nest produced two, while the other three produced none. Once a species has gone extinct, there is no going back. Please help them before it is too late. They have as much a right to live here as we do.
Maria Stockmal	Connecticut	Other (please specify)	Osprey advocate	I endorse the National Audubon Society's recommendations in an effort to advocate a live and let live policy. The Osprey who are affected by this produced only one offspring out of five nests this 2026 season. This is wrong. We spend much time trying to keep species from becoming extinct. The Bald Eagle and the Osprey are two such species. Do we put the Osprey on the endangered list again?
Reed Cass	Connecticut	Private recreational angler		I fish in the mouth of the CT River and have noticed a steep decline in the osprey population on Great Island. Most of the nest stands were not used in 2026.
Glen Cummings	Connecticut	Concerned stakeholder		I have been a monitoring Osprey Steward since 2014 and reporting to CT Audubon Osprey Nation my observations up to 2026. These last 2 years have been abysmal in the loss of our Osprey fledglings! Of my 5 nests I monitored in 2025 - 2026 only 2 of those 5 nest had a result of 1 fledgling.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Karen Morley	Connecticut	Other (please specify)	An osprey steward for the Connecticut Audubon Society	I have been an Osprey Steward for CT Audubon for ten years (I'm responsible for watching two Osprey nests and reporting on them semi-monthly), and I've seen the effects from the over-fishing of menhaden first-hand. The last two years have been extremely difficult for the adult Ospreys to be able to keep their young nourished and alive. During the 2025 season, both of my nests had only 1 chick that survived and fledged, and during this recent 2026 season, neither nest had a surviving chick (both nests initially had 2 hatchlings). Compare these results with the 2024 season, when one nest had 3 fledglings and the other had 2. I urge the Atlantic States Marine Fisheries Commission to reduce the Chesapeake Bay fishery cap by 50% to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Ospreys, are not put in even greater jeopardy. Thank you for your time and for considering public input in this vital decision for our wildlife. Sincerely, Karen Morley
Peter Russell	Connecticut	Private recreational angler		I have lived on the CT shore for most of my 64 years. I can't remember a time when there have been fewer Bunker. The fact that one company in a small region of one state can go against the interests of the most densely populated multi state region in the US and thousands of small businesses that depend on recreational angling, summer tourist trade and bird watching is a affront to democracy.
Jessica Snajder	Connecticut	Concerned stakeholder		I live along the Housatonic River in Stratford, Connecticut. The osprey have become a welcome sight in my neighborhood and I would love their primary food source to be protected so that these birds can thrive in our coastal communities.
Winifred Gordon	Connecticut	Concerned stakeholder		I live in Connecticut and have observed the poor breeding success of ospreys in our state. I urge the commission to follow the Audubon's recommendations toward strengthening the osprey population.
Val Koif	Connecticut	Concerned stakeholder		I live next to and can directly observe many osprey nests at the mouth of the Connecticut River. This years fledgling count was far less than previous years, and I saw far fewer fish being fed to nestlings; plus, the size of the menhaden was far smaller than I saw in previous years. While this isn't a formal study, it is direct observation of many nest. Please reduce the fishery cap! Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jane Kolodgy	Connecticut	Concerned stakeholder		I live on a salt marsh with 2 active Osprey nests. In previous years, one mating couple would fledge 3 chicks. In 2025 I saw a decline in activity and this year chicks were lost; nests were then abandoned. We've fought too hard to bring them back - let's not let it slip away now. Thank you
susan mcnamara	Connecticut	Other (please specify)	lover of ospreys	I missed the osprey and their fishing this year, Ct has great efforts to provide platforms and support of the osprey. What happened this year was greedy fishing.
Terry shaw	Connecticut	Other (please specify)	Concerned about a major shortage of Menhaden, Osprey are starving/ dying	I really believe you should stop fishing altogether for Menhaden, you have lowered the stock of this valuable fish so low that they need several years to catch up.
Gianna Mascola	Connecticut	Concerned stakeholder		I strongly urge the ASMFC to reduce the cap by 50%, with option B2 for catch distribution, to ensure greater menhaden availability during critical periods of the Osprey breeding season. The unprecedented decline in Osprey populations across the eastern seaboard, including record-low results in Connecticut this year, should serve as a serious warning. Osprey and countless other wildlife species depend on menhaden as a vital food source and will continue to be impacted without immediate action. Thank you for your consideration.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Madeline Oberempt	Connecticut	Concerned stakeholder		I strongly urge the ASMFC to reduce the cap by 50%, with option B2 for catch distribution. Through my work with the Connecticut Audubon Society's Osprey Nation program this season, I received and compiled data from more than 400 volunteers monitoring Osprey nests across Connecticut. The results were alarming. Productivity fell to just 0.87 chicks per breeding pair, the lowest in the program's 14-year history. A total of 261 nests experienced a reproductive failure, more than double last year's figure. Even among successful nests, nearly 100 chicks were lost. For the first time since the program began, the majority of successful nests produced just one fledgling rather than two. Anecdotal reports from Osprey Nation stewards echo these concerns- fish deliveries to nests were smaller and far less frequent than in previous years, and in many cases, both adult Ospreys had to leave their young unattended in the nest, presumably to hunt. This season's unprecedented decline in breeding success should serve as a serious warning. Osprey and countless other wildlife species will continue to be impacted if action is not taken immediately. Again, I strongly urge the cap be reduced by 50% and that option B2 be adopted to help ensure greater menhaden availability during critical periods of the Osprey breeding season. Thank you.
Kate Paster	Connecticut	Other (please specify)	general public	I support reduction by 50%. Adult fish are not making their way north. Osprey and other populations are suffering.
Patricia Hurley	Connecticut	Concerned stakeholder		I urge the commission to reduce the fishery cap by 50% to help ensure enough menhaden remain available for Ospreys and other wildlife.
Bill Rankin	Connecticut	Other (please specify)	Friend of the Osprey	I volunteer for the State of Connecticut monitoring endangered shorebirds, and I am actively concerned about the viability of our Osprey population.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Calvin Hansen	Connecticut	Private recreational angler		I'm on the ocean over 300 days a year in Fishers Island Sound. Every year since I can remember I have seen fewer and fewer adult menhaden in our local waters, and as of three three years ago I haven't seen a single one in both the Pawcatuck and Mystic rivers, let alone Fishers island sound. Something needs to be done to help their population rebound. With a lack of menhaden we have seen negative effects across many species, mainly striped bass, brown sharks, Sand tiger sharks, and bluefish, and those are just the ones I come in contact with.
Joseph Lederer	Connecticut	Private recreational angler		I'm thankful to this body for your work and dedication in managing our fisheries. Myself and my peers who fish regularly appreciate the attention to the Menhaden harvest as we all believe that reducing it is the most critical element in supporting multiple species of fish on our coast. Thank you.
Kerry Hart	Connecticut	Other (please specify)	Rec boating on ct river	I've seen the decline in Osprey.
Cristelle Bandzes	Connecticut	Concerned stakeholder		I'm here on behalf of Connecticut Audobon. The Osprey reproductive numbers are incredibly concerning. Whatever this body decides to do, I hope they continue to keep the entire ecosystem in mind, not just the anglers. The osprey need our help, desperately, and there is no clearer warning sign than what's happened this summer.
Nathan Sheff	Connecticut	Other (please specify)	CT resident, no financial interest	I'm submitting my comment as a member of the Connecticut Audubon Society. Osprey populations are in decline due to a lack of food, and limiting the menhaden catch will help them recover.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Zachary Schwartz	Connecticut	Other (please specify)	Concerned citizen	I'm submitting this public comment due to serious concerns raised about the impact of overfishing of menhaden on osprey populations, as detailed in this article: https://www.audubon.org/magazine/ospreys-chesapeake-bay-are-starving-death-disastrous-rates-what-will-it-take-save-them Ocean Harvesters fishing of menhaden accounts for 70% of the entire atlantic population of the species, leaving nowhere near enough for the Osprey that rely on them as a food source. Because of this, Osprey populations are declining at a staggering rate, worse than at the height of DDT. But instead of dying in their eggs, the young are starving to death in the nest, for want of their primary food source: Menhaden. The population of live osprey chicks surveyed in the Chesapeake bay is less than half of the required rate for the survival of the species. The current allowances for fishing of menhaden in the watershed is completely unsustainable. If no action is taken, this magnificent species will go extinct.
Caroline K Tighe	Connecticut	Concerned stakeholder		I'm very concerned about declining Osprey numbers throughout the ecosystem. I feel this is an indicator for future problems with other species.
eileen kopec	Connecticut	Other (please specify)	Volunteer St. of CT. Audubon Osprey Monitor	I'm very concerned about over consumption by those of us in wealthy nations. We take too much of everything. We use too much of everything. Planet earth cannot sustain this increasing demand by people. The natural world suffers from our selfishness. Our contamination & exploitation of the environment is sin against the natural world.
Brian Anisimov	Connecticut	Private recreational angler		In an abundance of caution, the menhaden fishery should be closed to all industrial parties like Omega. Small vessels operated by local fishermen should be the only exception.
Lynn Fortin	Connecticut	Concerned stakeholder		It is critical that the food source (Menhaden) of the Ospreys be regulated in order to conserve the species.
Cathy Kashanski	Connecticut	Other (please specify)	Osprey & other bird and wildlife viewer	It seems a tragedy that overharvesting of menhaden is likely leading to osprey reproduction declines (and who knows what other species are negatively impacted) and that Omega Protein and others just grind up the menhaden for cosmetics, pet food and other unnecessary uses. The Total Allowable Catch for these selfish and superficial uses should be reduced so that other species can live and thrive.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Melinda Hill	Connecticut	Concerned stakeholder		JUST SAVE OUR OSPREYS.
Dianne Saunders	Connecticut	Other (please specify)	Conservation Commissioner Town of Fairfield	Last year, Connecticut Audubon's Osprey Nation recorded its lowest osprey breeding success since the statewide community science program launched in 2014. Because Ospreys feed almost exclusively on fish, Osprey Nation serves as an early-warning system for the health of Connecticut's waters and the abundance of prey species like Atlantic menhaden. By Aug. 1, 2025, out of 706 nests with up-to-date reports, 113 had failed — about 1 in 6. In the same timeframe this year, of 691 nests with up-to-date reports, 171 have failed — roughly 1 in 4. For decades, abundant menhaden at the mouth of the Connecticut River helped sustain the largest concentration of nesting Ospreys on the Connecticut coast at Great Island in Old Lyme. As observers notice menhaden becoming increasingly scarce, Osprey reproductive success has sharply declined. At Great Island — what was once a former Osprey stronghold — only 27 Osprey chicks fledged in 2025, which decreased from 37 in 2024. So far this year, just five chicks have fledged. Osprey chicks are starving. Please do everything you can to preserve their food supply.
David E Shellenberger	Connecticut	Other (please specify)	Advocate for wildlife conservation, including ospreys.	Let's protect ospreys, which are dependent on the fish.
Taylor Perry	Connecticut	Private recreational angler		LIMIT THE BUNKER HARVEST AS MUCH AS POSSIBLE
Joyce Leiz	Connecticut	Concerned stakeholder		Menhaden declines are impacting Osprey populations as well as marine mammals, sea birds, and game fish populations. Allowing the menhaden population to become sustainable will have great impacts for the environment.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert Braunfield	Connecticut	Other (please specify)	Conservation ist / Naturalist	Menhaden is an important prey species for at risk Osprey, whose numbers have dramatically declined due to lack of food. Please lower the cap for the Menhaden harvest to assure that these birds, as well as many other marine animals dependent upon Menhaden , will have heathy population numbers into the future.
Catie Resor	Connecticut	Concerned stakeholder		My concern is the health of the area osprey population which is failing to reproduce likely because of lack of preferred food resources (menhaden)
Debra Bologna	Connecticut	Other (please specify)	Concern for osprey well being	My primary concern is that the osprey population has enough food. Currently they do not. I am asking that this issue be addressed and modified to sufficiently allow for enough food for osprey populations to thrive.
George Roberts	Connecticut	Concerned stakeholder		My primary reason for advocating for a reducing the bay cap is to increase available food sources for Ospreys.
Ross Bourdeau	Connecticut	Private recreational angler		No
Alicia Tillinghast	Connecticut	Concerned stakeholder		No
Stephanie Kollet	Connecticut	Concerned stakeholder		No comment
Paul Caouette	Connecticut	Private recreational angler		None at this time. P
Arnold Pritchard	Connecticut	Other (please specify)	Avid Birder and user of outdoor recreation	Not sure about the last few questions so I left them blank.
Joe Dalsey	Connecticut	Private recreational angler		Nothing matters more than having a strong Bunker population. There is no place for over extending the comercial harvest in one specific area.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jeff Woodring	Connecticut	Private recreational angler		OH MY - please make future surveys less complicated. I am in favor of making the most drastic reductions in commercial menhaden harvest. We are at epidemic stage and need real reductions.
Heidi Brierley	Connecticut			Osprey and other birds are being harmed. Reducing menhaden harvesting is critical to the birds' survival.
Christina Gruppuso	Connecticut	Concerned stakeholder		Osprey populations need to be protected. Menhaden overfishing needs to stop.
Janet Booth	Connecticut	Concerned stakeholder		Ospreys are a vital constituent in the natural world of the East Coast. All species play vital roles in the ecosystems of our world, and that only benefits humans, which is why we need to make sure Ospreys have enough food. Let's go for balance when we take from our resources. Ospreys are an iconic presence in our skies. They need their food source.
Jill Notar-Francesco	Connecticut	Other (please specify)	Osprey steward registered through CT Audubon Osprey Nation	Our last two seasons as an Osprey steward were shockingly disappointing. This year, the pair produced three chicks. Two were later observed, then one, then none. No fledgling occurred.
Amy Haynes	Connecticut	Other (please specify)	Citizen who treasures marine animals	Our osprey population is starving because of human greed and carelessness. These birds belong to all of us and we must protect them for our and our children’s future. If we fail to be good stewards of our planet, we all will pay the price
George Baldwin	Connecticut	Private recreational angler		Our stripers are disappearing, our osprey chicks are starving and we’re not seeing menhaden the past few years in harbors that are normally loaded with them every year. This is a big problem. I work on New Haven Harbor every day, and this is my 27th year doing that. I know what I’m seeing.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Dale Dubina	Connecticut	Other (please specify)	Concerned citizen	Overfishing is damaging to the food chain of many species. Please consider this urgent issue and its impact on the many life forms in the Atlantic seaboard area.
Arielle A Franklin	Connecticut	Other (please specify)	Private citizen concerned about the continued welfare and procreation of local osprey populations.	Overfishing is killing our local ospreys. We need to stop it now.
Christine Krumperman	Connecticut			Perhaps a synthetic replacement for menhaden in the drugs they are creating .
Deborah Rowe	Connecticut	Other (please specify)	I have volunteered as a nest monitor	Please advocate to ensure Osprey population protection for now and in the future for our planet and for our children!!!
Elizabeth N Horrigan	Connecticut	Other (please specify)	Involved with CT Audubon Society - CT resident concerned about osprey	Please consider and protect this key food source for the osprey

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Leslie Lofthouse	Connecticut	Other (please specify)	Concerned citizen	Please consider the environmental “Big Picture” impact. Dolphins, Whales, Osprey, Eagles, etc…. You know best what will harm & what will help this dying world. Consider your legacy, consider the future please. May God be in your heart to care and do the right thing.
Erin Murphy	Connecticut	Concerned stakeholder		Please consider the other species that rely on these fish. Thank you.
Shirley Lasch	Connecticut	Concerned stakeholder		Please consider the value of both wildlife and resources in these decisions.
Nicholas Hutchinson	Connecticut	Private recreational angler		Please do the right thing. These decisions impact so many fisheries and ecosystems and it's in your hands to do the right thing.
Sandra Loether	Connecticut	Concerned stakeholder		Please help save our Osprey. Thank you.
Abby Hausberg	Connecticut	Concerned stakeholder		Please implement measures to protect ospreys.
jennifer G Frank	Connecticut	Concerned stakeholder		Please implement these reduced Menhaden harvest quotas, to assure the adequate supply of Menhaden for fisheries and wildlife further up the coast in New England. The Gloucester, MA and Rhode Island fisheries have all been impacted by the shrinking supply of Menhayden. Also sea birds such as Osprey here in CT. Please take these steps to assure adequate food supply in the future.
Evan lang	Connecticut	Concerned stakeholder		Please just do the right thing and allow menhaden stocks to rebuild to a sustainable amount before it gets to a point of complete collapse if it isn’t already there. I know that’s a hard ask because it’s a billion dollar industry but for once please just consider the impact on all marine life on the east coast including multiple federally protected species.
Mary Giglio	Connecticut	Concerned stakeholder		Please leave enough fish to support a thriving population of osprey.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Cynthia Kuzman	Connecticut	Concerned stakeholder		Please let's save the Ospreys. Once they are gone.. they are gone. Americans have multitudes of things to eat. Honor the birds!!!! They have no one but us to protect them.
Richard V Kollet	Connecticut	Concerned stakeholder		Please restrict over fishing of menhaden to save the ospreys! Focus must be on protecting wild life over the glamor and glitz of over fertilized green lawns. We will regret not doing this!
Christina DiPalermo	Connecticut	Other (please specify)	Concerned Osprey lover	Please stop the over fishing. It's taken 30 years to get the osprey population to recover. You're starving them to death.
Randy boyer	Connecticut	Private recreational angler		Please stop them from harvesting all these fish, inhave watched them decimate the long island sound, it is so sad to see this happening not only effecting the fishing but many wild life species as well. I used to see acres of bunker and haven't seen them in 3 years. No bunker, no fish no wild life there killing everything. Please stop it
Janice Ross	Connecticut	Other (please specify)	Birder and Audubon vounteer	Please strengthen fishing limits on menhaden so the species can continue to meet the needs of people, birds and other fish and wildlife. Thank you.
Stephanie Mastri	Connecticut	Concerned stakeholder		Please support reducing the fishery catch for menhaden to allow for Osprey to continue to survive
Nancy Morris	Connecticut	Concerned stakeholder		Please take action to protect the menhaden for the osprey .
Justin Quigley	Connecticut	Private recreational angler		Politicians and board members need to be held accountable! They aren't following the science and running this fishery into the ground. More menhaden need to be left in the water. Canada is profiting off this fishery and ruining the fisheries of the entire east coast.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Dyann Hathaway	Connecticut	Other (please specify)	Lifelong CT resident concerned about osprey and other shore birds	Protection of osprey and other marine life is my primary concern and need to be protected from overfishing!
Matthew Brescia	Connecticut			Reduce by 50% please
Jim Roberts	Connecticut	Private recreational angler		Restrict commercial harvesting within 5 miles of coastline.
Christofor Tella Jr.	Connecticut	Private recreational angler		Save our freakin bunker and cut the quota drastically. I fish in CT and there are hardly any bunker anymore.
Frank Mantlik	Connecticut	Other (please specify)	Naturalist	Scaling back Menhaden catch is crucial to the welfare of the whole marine food cycle, and especially Ospreys.
Linda Thomas	Connecticut	Other (please specify)	concerned citizen environmentalist and osprey observer	Science and observation programs being conducted by CT Audubon and others have discovered a direct link between eastern seaboard osprey nest failures (and their declining population) to declines in the menhaden population. Ospreys are a top predator, living almost exclusively on fish and raising their chicks on menhaden diets. When the menhaden declines, osprey populations plummet, and that is what the evidence is showing over the past 2 years. Ospreys are like the canary in the coal mine. What happens to them offers a more accurate window on what is happening with the menhaden population, which is obviously crashing too. There needs to be very strict limits on the menhaden catch, or we will have neither menhaden nor ospreys in our future.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Dwyer	Connecticut	Private recreational angler		Since I have had a commercial lobster license in the 90s I have watched bunker disappear from southeast Ct waters… never see any schools…
Sandra W Soule	Connecticut	Concerned stakeholder		Sorry, these questions are much too technical for me. I fully support all measures to help the osprey survive and thrive!
Micky Komara	Connecticut	Concerned stakeholder		Speak up for the ospreys, who cannot speak up for themselves. Save this magnificent bird.
Jeremy Clapp	Connecticut	For-hire vessel owner/operator/crew		Stop OMEGA PROTEIN INC. !!!!!!!
Jack Egan	Connecticut	Other (please specify)	Beach goer	Stop overthinking it and stop overfishing
Josh Rayner	Connecticut	For-hire vessel owner/operator/crew		Stop the overfishing of menhaden, get the numbers right, the science and observations of anglers doesn't lie
Greg	Connecticut	Concerned stakeholder		Take action to preserve Manheden as a food source for predators like Osprey.
Evan S. Griswold	Connecticut	Concerned stakeholder		The Board should assure that the reduction catch protects other species in the menhaden food web.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kristofer Rowe	Connecticut	Other (please specify)	Wildlife conservation ist concerned about species that prey on menhaden	The collapse of Menhaden is catastrophic to the eastern seaboard. End the reduction fishery now. Save the smaller commercial operations and more importantly save the food chain that depend on menhaden. Osprey are the most important biomonitor we have and their decline in nesting populations from Virginia North to NJ, NY, CT etc it cataclysmic. Save the menhaden and save the world
Barbara Kami	Connecticut	Concerned stakeholder		The Commission must be very mindful of the harmful impacts of commercial menhaden fishing on many ecosystems that extend hundreds of miles from the commercial fishing grounds.
Lisa Wahle	Connecticut	Concerned stakeholder		The Commission needs to set limits in the most precautionary manner that ensures all ecosystem players thrive.
clarence hayes	Connecticut	Concerned stakeholder		The council should be more involved in the development of better measurements of the status of menhaden populations. The 'there is no settled science' argument from Omega needs to be settled with science. Precaution until then, but getting the data is important for the long term
Devan Krishnan	Connecticut	Other (please specify)	I am with the Audibon	The fish in the Chesapeake are very important for the Marine ecosystem and must be protected at all costs.
Bill	Connecticut	Private recreational angler		the fishery is non existent in LIS the last two years. it needs help. please do so
Eleanor Ferguson	Connecticut	Concerned stakeholder		The magnificent osprey has survived and thrived with conservation efforts before now that eliminated DDT and the crisis of fragile eggs. Now the osprey are threatened again and need immediate help which can be given by a 50% reduction in the Bay Cap. Please consider carefully that the Commission has the power and hopefully the will to do the right thing and reduce the menhaden catch so the osprey can thrive and grace our shores with their beautiful presence.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jerry porter	Connecticut	Concerned stakeholder		The menhaden have been pushed to the breaking point. It has affected the Osprey and the broader fishery in LI Sound. Please limit the catch now before it's too late for the menhaden and the osprey
Virginia Lyons	Connecticut	Concerned stakeholder		The osprey made an astounding recovery after DDT was banned in 1972, and the addition of encouraging nesting platforms along the shore and its wetlands, so it is regrettable that there is strong data of a recent decline in numbers and in chick survival rates. Since osprey feed almost exclusively on fish, menhaden being a major source, it was logical to investigate the contribution of overfishing. A 50% reduction in annual allowable menhaden harvest should begin to increase numbers of osprey within the 3 year reevaluation period, and the annual data accumulation could be adjusted accordingly. 1 year would be insufficient to make a judgment as to the effectiveness of this approach, and allow continued investigation of possible other contributing factors. The proper distribution of the reductions over the harvesting period requires information about menhaden fish, and menhaden fisher habits that I do not possess.
Kim Hoehn	Connecticut	Concerned stakeholder		The Osprey population is in serious decline; potential species extinction is inevitable if their primary food source is not available. Reductions in commercial menhaden catch is needed. Thank-you for your consideration of this very important matter.
Sarah Middeleer	Connecticut	Concerned stakeholder		The osprey population is tanking. Chicks are starving because of overfishing. Please limit allowable catches by at least 50% of what is allowed currently. Thank you.
Noel Abbott	Connecticut	Concerned stakeholder		The ospreys along Long Island Sound and its tributaries are all like family to us. Please ensure that their offspring will not starve by keeping a healthy population of menhaden in our waters. Thank you
Johann Heupel	Connecticut	Concerned stakeholder		The ospreys depend on a healthy menhaden population. Regular revisitation of quota caps, less harvest, more focused on later in the year, is the only way to ensure their survival.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Loughney	Connecticut	Other (please specify)	Avid naturalist and birder	The over fishing and exploitation of the Chesapeake Bay is greedy and despicable. There are estimates of over 80% nesting failure for ospreys (and devastating outcomes for numerous other fish species) on the East Coast, particularly in Connecticut. I am astonished that an industry (the fisheries) would undertake action that not only destroys our natural world but also has as its logical conclusion the collapse of its own livelihood alongside our ecosystem. Enough with the greed and the stupidity. Set the quotas for menhaden caught at the lowest possible level and ensure the highest, economically painful accountability for non-compliance.
Jeffrey Champion	Connecticut	Other (please specify)	Recreational angler and Manager of the Borough of Fenwick	The overfishing of menhaden not only is adversely affecting the fishing in the area but it is also affecting the food supply for Ospreys, Eagles, and other birds species. It is becoming extremely noticeable on our Osprey stands - thank you.
MARY TESLA	Connecticut	Concerned stakeholder		The reduction of menhaden greatly impacts our osprey population
Candi Calcandy	Connecticut	Other (please specify)	Audubon osprey steward Beacon fall Ct #4	the strongest option on the table — the full 50 percent Bay cap reduction, tied to the coastwide limit and split across three seasons under Option B2's 25/25/50 allocation, meaning the fewest menhaden would be removed during Osprey nesting season — really don't understand all the previous questions, all I know is that my osprey nest had no birds or babies this year due to lack of fish
larry lavender	Connecticut	Concerned stakeholder		the well-being of the osprey is an important marker of the overall well-being of the ecosystem. Officials need to think long term ecological well-being, not short term profit.
Matthew Greger	Connecticut	Private recreational angler		Things are changing, season, temperatures, patterns. Let's do our due diligence here.
Perry Montrose	Connecticut	Concerned stakeholder		This is a key species for the birds in the area, who have been struggling to find food sources and seeing their populations reduced. It is imperative that we reduce the harvest to protect this food source for a multitude of birds.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Dawn handschuh	Connecticut	Concerned stakeholder		This is way too complicated for me to complete on a cell phone. If I don't get back to this on my desktop computer, please know that I am strongly in favor of a menhaden cap and or other restrictions that give Osprey a chance to recover from a very poor reproduction year
Mary Howard	Connecticut	Private recreational angler		This survey does not address commercial menhaden fishing. Why not?
Stopka Lori	Connecticut	Private recreational angler		This survey is overcomplicated for a recreational fisherman to fill out. Keep the question simple and you'll get more accurate responses. Bottom line reduce the number of the harvest. Whatever it takes.
Letitia Burton	Connecticut	Concerned stakeholder		Up until recently, ospreys represented one of the few success stories in nature that we could use to teach children how when humans care, they can help nature bounce back. Now just like in the 1970s, their numbers are dwindling again. Once again, we need to step in and do the right thing.
Lauren Curran	Connecticut	Other (please specify)	Concerned about the impact Osprey	urging the ASMFC to reduce the fishery cap by 50%, a precautionary measure to ensure that menhaden, a key foundation fish and a prime food source for Connecticut's Osprey, are not put in even
Linda Gryckiewicz	Connecticut	Private recreational angler		Want a 50%reduction in the bay cap with option B2 for how the catch is distributed in amounts across time
Charla Spector	Connecticut	Other (please specify)	Birdwatcher and Protector	We are extremely concerned about the STARVATION of Ospreys, which were previously brought back from EXTINCTION caused by DDT. Now they are facing large population drops because of over-fishing. We hope you will PROTECT the OSPREYS from STARVATION from over-fishing.
Nicholas L Webb	Connecticut	Concerned stakeholder		We need critical reduction now.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jennifer	Connecticut	Other (please specify)	Interested party	We should adjust the food source review to include the birds and animals that need this source to survive. If 50% reduction help to stabilize/increase the current needs it is important to give this effort a chance.
Brad Buffington	Connecticut	Private recreational angler		Western long island sound has had no adult size manhaden the last 2 years. I have never seen anything like it in my 40+years of fishing. something dramatic needs to be done. purse seiners have to be limited. It's changing the whole enviroment.
Adam Callaghan	Connecticut	Concerned stakeholder		We've seen this time and again, so we all know what's needed in a situation like this: short-term pain for long-term gain. Set proper limits now so that the fishery can be managed sustainably long-term for everyone's benefit, not extracted en masse until its collapse for the short-term economic gain of one corporation.
Toby Lapinski	Connecticut	Private recreational angler		While I completely support reduction of the Chesapeake Bay menhaden fishery, simply redistributing it to the coastal fishery does little to nothing to conserve the coastwide stock. Any reduction in the Bay fishery should also be reflected in the coastal fishery.
Joseph Majesky	Connecticut	Private recreational angler		Why not just ban this fishery. The consequences are dire. Striped bass are plummeting. Bluefish are thinning out. Ospreys are dying. The Atlantic cannot sustain the removal of the lower rungs of the food chain.
K. Smolkis	Connecticut	Other (please specify)	concerned citizen	Wildlife, especially osprey, are dying because they need a bigger supply of menhaden. The Connecticut Audubon Society has research data to back that up. Please reduce the Bay Cap as much as possible. Thank you.
Elizabeth Hanahan	Connecticut	Other (please specify)	Osprey nest monitor	With critical nest failures of osprey occurring in Chesapeake Bay and now being seen all along the Atlantic coast due to lack of menhaden, their primary food source, it is important to limit fishing during nesting season to reduce the numbers of nestling starvation. Limiting the overall catch would also help the men harsh population rebound which would be beneficial to osprey and the fishery industry as well in the long term.
Mary Graham	Connecticut	Other (please specify)		Concerned with overfishing starving Osprey

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Carol E Skog	Connecticut	Other (please specify)		Birder Want to save Osprey that eat Menhaden fishermen are taking

Eve Burhenne	Connecticut	Other (please specify)		Concerned for ospreys
Kathleen Riley	Connecticut	Other (please specify)		osprey steward Old Saybrook,CT
Judith Fisher	Connecticut	Other (please specify)		Have osprey box on my marsh
Donna Rae Caporaso	Connecticut	Other (please specify)		Abide birders who recently brought malnutritished osprey to rehab
lindsay Baron	CT and RI	Concerned stakeholder		Osprey Nation findings show the worst breeding success in its 13-year history, along with other troubling signs: • 0.87 chicks per breeding pair, down from the previous record low of 1.26 in 2025. • For the first time, the majority of successful nests only produced a single fledged chick, adding to concerns that Ospreys are struggling to find enough food. Action needs to be taken by fisheries to preserve the food chain now.
Will Sternberg	CT, MD, VA, NC, and Washington D.C.	Private recreational angler		Menhaden are the life blood of the Atlantic coast and need to be protected more than they are currently. Long Island sound stopped the menhaden harvest and has seen striper numbers rebound significantly.
Seth Price	Delaware	For-hire vessel owner/operator/crew		As a fore-hire kayak fishing guide operating in the mid Atlantic region I have seen the effects of over harvest of menhaden including the starvation of our local osprey population and urge ASMFC to enact a quota reduction.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jodi McLaughlin	Delaware	Other (please specify)	I monitor ospreys for Delaware Fish and Wildlife/osprey-watch.org	For the past 14 years I have volunteered with DE Fish and Wildlife, Tri-State Bird Rescue and DE Center for the Inland Bays with a focus on Osprey conservation and nest reproductive monitoring of over 100 nest sites primarily in Sussex County. In the past 3 years, I have personally observed osprey nesting success plummet, held emaciated adult and young ospreys in my hands and watched osprey chicks starve in abandoned nests because the adults spent long periods of time away from the nest attempting to save themselves. And the ospreys are the showy species we can see and study. In the 2026 season, I confirmed 162 active nesting pairs produced only 60 young. .37% chicks per nest is similar to the DDT era. 55 years passed and here we are again in 2026. Ospreys represent: they are not isolated in the environment. Industrial Reduction Fishing is depleting not just the critically important Chesapeake Bay, but our Atlantic Coastal waters. Menhaden not only feed our ospreys and other marine birds and animals but they uniquely filter the algae and phytoplankton that few other saltwater animals clean from our warming and increasingly vulnerable waters. The warning signs are flashing! Healthy bays, coastal waters and the many Atlantic coastal states socioeconomic systems require the ASMFC to vote for the strongest conservation options in November. 50% Bay Cap, 3-year review is the beginning of a necessary environmental coast wide correction.
Jason Russell	Delaware	Private recreational angler		I would like to see this implementation last for a period of time where results can be quantified. Short periods lead to skewed results.
Edward J Dobbins	Delaware	Private recreational angler		It is an absolute disgrace that Omega protein, a foreign company in the pockets of Virginia politicians, is allowed to literally decimate this fishery. Do something and do it right!!
Andy	Delaware	Private recreational angler		Make it easy, keep the bunker fleet out of the Ches Bay period and keep them at least three miles offshore. Too many bass and other species are caught and killed as by catch by the bunker fleet. Stand up to Omega and do what’s right for the bay not Omega. Thanks.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Patricia Evans	Delaware	Concerned stakeholder		None
Patricia Ashmead	Delaware	Concerned stakeholder		Osprey nest on my dock for past 10 years - noticeable decline in chicks (number born, survival/fledge rate) and quantity of fish provided by parents in past 3 years
Tara Schmitt	Delaware	Other (please specify)	Wildlife Enthusiast	Please protect our Ospreys and other wildlife.
Brandon Hamilton	Delaware	Private recreational angler		Public Comment in Support of Closing the Chesapeake Bay Menhaden Reduction Fishery Dear Members of the Atlantic States Marine Fisheries Commission, I strongly support a complete closure of the menhaden reduction fishery in the Chesapeake Bay. Over the past ten years, I have personally observed a dramatic decline in menhaden along the Delaware coast. Areas where menhaden once seemed abundant now appear to have very few. I recognize that the reduction fishery may not be the only factor responsible for this decline, but the apparent depletion is concerning enough that continuing to remove large quantities of this important forage fish is an unnecessary risk. Until an appropriate study can determine the causes of the decline and establish that the population can support the reduction fishery without harming the broader ecosystem, I believe the precautionary approach is to close the reduction fishery in the Chesapeake Bay. Menhaden are a critical food source for many species and an important part of the coastal ecosystem. We should not wait until their decline becomes irreversible before taking action. Please support a complete closure of the Chesapeake Bay reduction fishery until sufficient science demonstrates that continued reduction fishing is sustainable. Thank you for considering my comments.
John hazzard	Delaware	Private recreational angler		Stop ruining the fishing. All you have to do is take a boat ride in August and you will see there are no bunker to be found.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Christophe Tulou	Delaware	Other (please specify)	Represent the DE Center for the Inland Bays - a national estuary program	These policy choices reflect growing concern throughout a large swath of the near-coastal Atlantic region over significant reduction of osprey reproductive success affecting an apex predator heavily reliant on menhaden as a food source. This comment also presumes the Commission's understanding of the food value and thus the foundational importance of these fish to other predators in our coastal Atlantic region. From the work of the Center for Conservation Biology at William and Mary, we recognize that osprey food stress is is very real in the Chesapeake. We see it in coastal Delaware, as well. Quick and effective response to reduce overall menhaden catch and avoid most reduction-fishery harvest during osprey breeding and fledging seasons is a prudent response to clear evidence of widespread and significant reductions in osprey reproductive success. If not addressed, this will lead to rapid reductions in coastal osprey populations. Given this data and its implications for osprey and likely other species dependent on or affected by the presence of sufficient menhaden populations--including those who catch, process and use menhaden-sourced products--it behooves all the ASMFC states to undertake and coordinate on full and credible assessment of menhaden stocks throughout the ASFMC region. Needless to say, these rapidly changing circumstances affecting osprey and likely other species compels a careful review and appropriate adjustment of the coastwide menhaden TAC, as well.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jamieson Martin	Delaware	Other (please specify)	Concerned citizen with passion for fisheries conservation	This draft proposes a solution crucial to maintaining the Chesapeake bay ecosystems. Reducing the menhaden fishing limits would allow for necessary revitalization of the menhaden population. Menhaden are a very important piece to the fragile chesepeake bay ecosystem, being a food source for various trophic dynamics. Menhaden serve as a food source for osprey, other marine birds, predatory fish like striped bass, bluefish, cobia, mackerel, and more. This drop in population will not only hurt the populations of these fish and marine birds, but will also hurt the renowned fishing industry within the bay. Sport fisheries like striped bass and cobia rely on menhaden, and will eventually start to decline with the menhaden population. These sport fisheries are a huge piece to the larger economy of the chedpeake bay area. So not only will protecting menhaden help stabalize their population, but will allow for consistent stabalization of fisheries that contribute to the local economy. Menhaden populations have been proven to have much lower biomass than originally anticipated. All in all, updating these limits will create a necessary shift in these crucial populations that hold together the fragile ecosystem of the chesepeake. I am in full support of this update.
Nicholas Wittkofski	District of Columbia	Concerned stakeholder		Be as strict as possible on industrial fishing that uses purse seine fishing. We should protect the bay over industry. Support local businesses/fishermen and wildlife, not national and international corporations. Make fines so high it's prohibitive to break the rules. Better yet, revoke licenses to corporations that don't abide by the rules. PROTECT THE BAY
Lisa Landsverk	District of Columbia	Concerned stakeholder		Given the importance of menhaden in the food chain, I believe no take of menhaden should be allowed. Decreases in populations of other fishes reliant on menhaden suggests overfishing.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Evan Kinnevan	District of Columbia	Other (please specify)	Biologist studying osprey nesting in the Chesapeake Bay	Having spent the summer monitoring osprey nests on the Chesapeake, I saw firsthand how the lack of menhaden is stressing the wildlife of The Bay. I came across too many nests that had dead emaciated nestlings and even more nests where the nestlings that survived were in such poor health I didn't know how long they would live after leaving the nest. During my trips monitoring nests, I was lucky enough to talk with people who have been around The Bay for decades. Their stories of "mile long" schools of menhaden reminded me of the stories of Passenger Pigeons flying overhead "blocking out the sky". I fear the short-term gains menhaden provide are overshadowing their importance as a foundation for the Chesapeake food web. They should be left in the water for the entire bay to enjoy and profit from, not for the benefit of a single corporation. The menhaden industry along the east-coast is a remnant of the past, with areas that have banned the practice experiencing rebounds in seabird, fish, and large marine mammal populations. The areas where Omega Protein harvest menhaden are experienced steep declines and the damage only grows. Osprey's nesting in New Jersey had their worst year on record as well. Just because the fishing occurs in The Bay, doesn't mean it's impacts aren't felt elsewhere. That's why cap of 50% of current harvests isn't enough to stop the stresses observed in The Bay. A moratorium should be in place to stop harvesting until there's a better idea of exactly how the menhaden are responding to the pressure of industrial fishing.
Peiyao Zhao	Florida	Concerned stakeholder		All signs are pointing towards severe overfishing of Atlantic Menhaden. I feel a 50% reduction in the bay cap is absolutely paramount while other mitigation measures are being surveyed.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James A. Baker IV	Florida	Private recreational angler		Although I live in Florida, I have owned a home on the Chesapeake Bay for almost 20 years, just north of the Bay Bridge, and, until recently, I fished there throughout that time, primarily for Striped Bass and Bluefish. For most of that time I have observed large pods of baitfish in the water from the late spring through the early fall. However in recent years, there appear to be substantially fewer and smaller such instances. Correspondingly, Bluefish have disappeared from the Upper Bay, and now, Stripers are relatively infrequent. Additionally, in the past few years I've observed porpoises swimming through the Upper Bay, which I surmise are in search of food. Why else would marine fish venture into the relatively fresher water regions of the Bay? The Chesapeake Bay is an American treasure. Restoration of its traditional, historic marine population dynamics serves the interests of a wide range of stakeholders beyond those of a single company and a relatively small segment of human Bayside populations.
Christopher Doggett	Florida	Private recreational angler		Based on both quantitative data (i.e., data from scientific studies) and qualitative assessments (i.e., observations from the recreational fishing community), I firmly believe that we are at a critical point and are risking the collapse of the striped bass fishery, other key recreational species, and the east coast ecosystem writ large, if we don't take substantial measures to bring the menhaden stock into better balance. I strongly encourage the ASMFC to take the most substantial changes possible now; waiting and taking a smaller step approach over a longer period will likely fail to achieve the desired results.
Susan Kapela	Florida	Other (please specify)	Consumer	Definitely set limits
Valerie Howell	Florida	Other (please specify)	general public	Encourage consideration of opinions of those of us who aren't anglers but are interested in marine populations and environment. I would like to see a total pause on fishing of menhadens so that the population can recover. Thank you.
Brad Wolpert	Florida	Concerned stakeholder		No

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
M C Loch	Florida	Concerned stakeholder		No
Lauren Johnson	Florida	Concerned stakeholder		Overfishing of menhaden jeopardizes critical food chains both in the sea and on land (e.g., ospreys). This important fish needs time to recover, and a plan to prevent future overfishing.
Carol Colucci	Florida	Other (please specify)	Concerned citizen	Please support Chesapeake Bay Ospreys by strengthening menhaden fishing limits. Thank you
Eric Draper	Florida	Concerned stakeholder		Provide enough food for abundant osprey populations.
John Gioulis	Florida	Private recreational angler		Reduce commercial harvesting.
Michael Dixon	Florida	Private recreational angler		Support science-based Chesapeake Bay menhaden management that recognizes the importance of this resource to healthy fisheries and the recreational fishing economy
Diane Augustus	Florida	Concerned stakeholder		Thank you again for allowing me to be included in the survey as actions are being considered
Anthony	Florida	Concerned stakeholder		Thanks for the opportunity to provide this input.
ROB VAN METER	Florida	Private recreational angler		The human factor in nature has upended her life balance. We are obligated not to destroy the treasures of all life.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ed Malin	Florida	Private recreational angler		There are not enough options in the questions above. Quit managing the fisheries from top down. Start at the bottom and manage up. Zero commercial harvest of menhaden, shrimp, mullet. Let the bottom of the food chain max out without commercial pressure and the middle and top of the chain will need less management. So simple. The largest waste of the entire resource comes from shrimp trawl bycatch. Not only do we kill an inordinate amount of non target species, we destroy the bottom where the food chain starts. It is so stupid. All this bullshit about percentages and total allowable catch. Zero allowable commercial catch at the bottom. Simple as shit.
Barbara Chancey	Florida	Other (please specify)	Concerned for Conservation	There doesn't have to be an either/ or regarding the fishing. Both humans and other species can share the fish. Humans do have access to multiple food sources, but other species depend on the fish to raise their families. Sharing makes it possible for humans and other living species to both survive.
Tom farrell	Florida	Private recreational angler		This is a very in depth science approach needed by biology professionals. We need a lot more exposure and input from the experts on this issue!
Cathie Wenderoth	Florida	Other (please specify)		I am a birder,vist Cape May to watch the Horsecrabs mate and see their migration
Penny Peek	Florida	Other (please specify)		Friend of Ospreys
Richard David Champion	Florida	Other (please specify)		concerned Human who knows we need to make room for all life on Earth.
M LeonardTyson	Georgia	Concerned stakeholder		Nothing short of a 30% reduction in overall harvest will be enough to significantly bolster the long-term sustainability of the menhaden fish population...

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Harvey Langberg	Georgia	Private recreational angler		Osprey populations rely on you to survive. Please make decisions with this in mind.
Jacqueline StJames	Georgia	Concerned stakeholder		Please protect our wildlife and natural habitats!
Delilah Kirby	Georgia	Private recreational angler		We cannot afford to treat the decline of the Chesapeake Bay osprey population as acceptable collateral damage for industrial fishing profits [ASMFC]. Ospreys are a vital sentinel species; their health directly reflects the health of the entire marine ecosystem [ASMFC]. Watching parent birds return to empty nests, unable to find the foundational menhaden required to keep their chicks from starving, is an ecological tragedy that demands immediate intervention [ASMFC]. Forage fish like menhaden belong to the public trust and the wildlife that depend on them, not to a single industry [ASMFC]. Implementing strict quota periods, overage paybacks, and a 50% cap reduction is not just a regulatory choice—it is a moral imperative to restore the balance of the Bay, protect a deeply cherished species, and ensure that future generations do not inherit an empty, broken ecosystem [ASMFC].
J. English	Hawaii	Other (please specify)	Biologist by training/Science Educator	Capitalism is impacting the ecosystem. From what I read today in multiple sources, the fish are not breeding/ living in the same spaces that they once did. There's a limiting factor in this equation that needs more research. Overfishing is an easy explanation, but one that needs more investigating.
Kevin Klatt	Hawaii	Private recreational angler		Reduce quota should reduce 50 % . How it is done . I don't care. If you made this survey easier ! More people would respond .
Celesta von Chamier	I fish in Maryland but live elsewhere	Private recreational angler		Our natural heritage is a finite resource. I hope the commission understands usage should be sustainable for the entire ecosystem involved.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Phil Shaw	I used to live in Virginia and visit the Chesapeake Bay and enjoy the wildlife and natural habitat there.	Other (please specify)	Wildlife and Nature appreciation	Maintain or enhance wastewater treatment and water quality treatment for surface runoff and maintain or enhance natural habitat restoration including riparian shoreline conservation iniciatives.
Alice McGrath	Illinois	Concerned stakeholder		I am a concerned stakeholder in that the health of the environment in the U.S. is vial to all our lives as Americans. Please end the overharvesting of fish so the Chesapeake ecosystem has a chance to recover.
Aiden West	Illinois	Concerned stakeholder		Menhaden taking caps effect more than just industry, private fishermen and local wildlife are highly effected by the collapse of these fishery populations. Ospreys especially, an iconic keystone species of the region, are facing local extinction.
Cheryl Henley	Illinois	Other (please specify)	Osprey Advocate	Need complete moratorium on overfishing until menhaden recover and Osprey recover to.Tbeir you g must survive Humans do not need Menhaden,Osprey depend on it for survival!!
Ruth Farmer	Kentucky	Concerned stakeholder		"I am writing to express my strong support for the maximum proposed reductions to the Chesapeake Bay reduction fishery cap and the immediate implementation of strict seasonal quota spacing. Atlantic menhaden serve as a critical foundation for the entire Chesapeake Bay food web. Their ongoing localized depletion by large-scale industrial purse-seine fishing directly threatens vital predator species. In particular, this food shortage has contributed to severe osprey nesting failures across the region, as adult birds struggle to find enough menhaden to feed their chicks. Other key species, including striped bass and marine mammals, are also suffering from this localized depletion. The ecological health, wildlife success, and long-term biodiversity of the Chesapeake Bay must take priority over industrial harvest volumes. I urge the ASMFC to adopt the most conservative options available in Draft Addendum II to prevent overfishing in these sensitive nursery waters and to ensure ecosystem stability."

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jared	Kentucky	Private recreational angler		Protect the Osprey
Stephen Dongo	Maine	Private recreational angler		I have been fishing for years and have noticed a major difference in the amount of baitfish. It takes a significant amount of time to locate bait now if you can find any at all. The striper fishery is going downhill fast because of it. Thank you for your time
Chuck Radis	Maine	Concerned stakeholder		In Maine, we still have successful osprey nesting, in part, because of our low quota of menhaden. I think it's a tragedy that the Chesepeak Bay quota has been so high, enabling large harvesters to decimate this important indicator species. Please, Please, pull drastically back onthe quotas so that we can have more feedfish for our ocean to remain healthy. Dr. Chuck Radis
Peter Mohlin	Maine	Private recreational angler		Please do the right thing and enact the most protective measures on this resource.
Rocco Risbara IV	Maine	Private recreational angler		Reduce the quotas, give menhaden a break. We see less and less in our area every year
Jean Burnett	Maine	Concerned stakeholder		There need to be limits on corporate gain when it is clearly in excess. Thank you for considering reasonable measures to ensure the future health of the fishery and all who benefit from it.
Germain	Maine	Private recreational angler		There needs to be reduction bigtime in the Bay. And it needs to happen sooner then later
David	Maine	Private recreational angler		There’s been a drastic reduction in striped bass populations in Maine due to our lack of baitfish

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James Conley	Maine	Private recreational angler		angler who cares deeply about the future of striped bass and the entire Atlantic coastal ecosystem. I spend hundreds of hours on the water every year fishing the New England coast. Over the years, I have become increasingly concerned by how difficult it has become to find Atlantic menhaden, commonly known as bunker. I rarely see the large, abundant schools of bunker that I remember seeing in the past. When I do find bunker, it is extremely difficult to find one over four inches. That concerns me greatly because larger menhaden are an important source of forage for striped bass and countless other predators. Bunker are not just another commercial fishery. They are a critical part of the marine food web and provide food for striped bass, bluefish, tuna, sharks, whales, seabirds, and many other species. Removing large quantities of bunker from the ecosystem removes an important food source from the animals that depend on them. As someone who spends hundreds of hours on the water, I see firsthand what is happening in our coastal waters. I am not asking for stronger management because I want to see commercial fishermen lose their livelihoods. I am asking because I want there to be enough bunker left in the ecosystem to support all of our fisheries and marine life for generations to come. I strongly support taking a precautionary approach to Atlantic menhaden management. We need abundant bunker in the water not simply enough bunker remaining to support continued commercial harvest. The health of the entire ecosystem should come before maximizing how many menhaden can be removed. I urge the ASMFC to support the strongest conservation measures available under Draft Addendum II and to seriously consider additional reductions in menhaden harvest if the science indicates that current removals are putting predators and the broader ecosystem at risk. If stronger restrictions, including a temporary moratorium on menhaden reduction fishing, are necessary to rebuild bunker abundance and protect the ecosystem, I believe those measures should be seriously considered. I care deeply about striped bass and the future of recreational fishing. Striped bass anglers should not have to wait until forage populations are depleted before action is taken. We have an opportunity to be proactive now rather than waiting for another fishery to decline and then imposing emergency restrictions or closures on recreational and commercial fishermen. We need to act now.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Catherine Haslam	Maryland	Private recreational angler		It is important to ACT now. While there may be some job losses in fishing fleet you also have to consider job losses to recreational fishing ,bird tourism , crab fishermen and multiple other supporting tourism industries if we lose ospreys and severely impact other fish species. Plus there are so many other threats we have little power over -- THIS one we can address. Please do so but reducing harvests as much as possible
Jeremy Mau	Maryland	Private recreational angler		I'm writing in support of the proposed reduction to the Chesapeake. Sustaining a healthy Atlantic menhaden population is critical to protecting the Chesapeake Bay's ecosystem and ensuring the vital food supply that predator species depend on. While a harvest cut may present short-term challenges for those in the fishing industry, securing a balanced marine environment ultimately provides more long term stability to jobs that rely on menhaden harvest.
Joseph Meadows	Maryland	Private recreational angler		8 Generations of my Family have been living and working off of the Chesapeake Bay. My future son is on the way and I want him to enjoy the Bay as much as I did and even more. I dream of never going out on the boat and seeing sludge floating on top and millions of fish swimming around.
Charles L. Ross, III	Maryland	Private recreational angler		A healthy bunker population supports the entire Chesapeake Bay ecosystem. The recommendations that I have chosen above will support this effort by requiring the following: A 50% initial reduction in the Chesapeake Bay Cap A Bay Cap linked to the coastwide quota Less concentrated harvest during critical spring and summer periods Accountability for seasonal quota overages A required review of the Bay Cap every three years
Freeman Jones	Maryland	Private recreational angler		A healthy Chesapeake Bay is essential to all wildlife and our children.
Gregory Hupka Jr	Maryland	Private recreational angler		A healthy sustainable Bay makes for a healthy sustainable state. Maryland waters have paid the price too long for the over harvest of this important fish species.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Paul Davey	Maryland	Private recreational angler		Allowing harvesting of Menhaden in the Chesapeake Bay is Disgraceful and any harvest if allowed should be a minimum of 3 miles off shore The fishery is being destroyed by Omega industrialized Menhaden extraction & it is causing immense damage to Maryland, Virginia & the entire Atlantic Coast
Jerry Dewese	Maryland	Private recreational angler		Any foreign companies should be taxed for any fisheries harvested. License fees should increase for all international companies that's harvesting in the Chesapeake Bay
Nathan Villiger	Maryland	Private recreational angler		As a Chesapeake Bay fisherman and hunter, I understand how deeply connected Menhaden is to the health of our recreational and commercial fisheries in the Bay. I want to see Menhaden return to numbers that allow for sustainable harvest to meet the needs of industry, and provide a food source for striped bass, redfish, cobia, bluefish and osprey that also call the Bay home. Menhaden are the basic producers of energy for larger migratory fish species that enter the bay to spawn and feed. Cutting the menhaden harvest is the fastest way to ensure that these species can recover and remain sustainable in the future.
Andrew Iserson	Maryland	Concerned stakeholder		As a concerned Maryland Chesapeake Bay Area citizen, I urge you to approve the Atlantic Menhaden Draft Addendum as soon as possible. Any delay in restraining the fishery's exploitation of a key natural resource will add to the harm and possibly preclude future restoration of the osprey and rockfish population that thrived here for centuries. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Wendy Dinova-Wimmer	Maryland	Other (please specify)	Photographer/Concerned citizen	As a photographer and concerned citizen for the welfare of the Chesapeake Bay region, I have seen many osprey nests fail in recent years and I understand that the population in the area has fallen below the point of sustainability. This is heartbreaking to see after witnessing their recovery since the elimination of DDT. Scientists and naturalists that I know personally are seeing an alarming number of osprey chicks simply starving to death. It is long past time to reduce the annual menhaden catch to help reverse this troubling trend. The birds and local fishermen simply cannot compete with mass scale commercial fishing using large destructive purse seine nets, which is another reason to limit the scale of the catch. Therefore, I support the proposal to reduce the annual catch by 50% and also support the 25%/25%/50% spread to push a higher percentage of the catch beyond the osprey nesting period. In addition, it makes no sense that ~ 75% of the entire east coast quota goes to one state: Virginia. Why? Especially considering that a foreign company is largely the one profiting from the menhaden caught in this area! It seems that a re-allocation of the entire east cost limit is also in order. Let's do the right thing as humans and take care of our osprey and the Chesapeake Bay for generations to come.
Gary Laubach	Maryland	Private recreational angler		As a recreational fisherman in the upper Chesapeake Bay for the last 30 years, I've seen a dramatic decrease in menhaden over the last 10 years. You can see this with all the antidotal evidence of the main schools of rockfish transitioning up into the northern Chesapeake Bay above the Chesapeake Bay Bridge, and hanging out there all year because that's where the little remaining bait lives. Due to the over fishing in the lower Chesapeake Bay. We no longer see the large schools of bait. The Bay is being depleted of menhaden, which is a critical source of food for many of the resident species who live there.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Kedda	Maryland	Private recreational angler		enough to see the Bay in all of it's glory. I caught my first rockfish in 1958 of a dock in the South river, 13" long. I was very proud. My folks were avid fishermen and we spent many hours fising from the Bay Bridge to south o Thomas point Light and what struck me most was the schools of fish breaking the surface, gulls working the water and the rock fish we caught. Ther schools of fish were the infamous Menhaden. the bay was in a balance, fish plentiful. As time went on thingss changed waters went from crystal clear to brown , sea grasses disappeared, crabs dwindled, as well as rockfish and the schools of Manhaden disappeared to the extent that they had once been. It took many years for the bay to recover and has been getting better the osprey came back and started to flourish. there was food / fish for everyone. but with the last 5 years or so a visible impact is occuring again and the bait fish that so drove the revitalization fo our beautiful bay is reversing direction. Osprey have ben effected greatly with the lack of bait fish. alowing the bay's resources to be taken before they reach the residents tht rely on their nourishment to sustain our a healthy stock is wrong. parking the large factory ships are ruining Marylander's natural resources, for all fish, birds, humans that depend on it. Regulate these factory ships and limit their catch by 50% and save the bay for future generations of animals & humans that depend on it. Attached is a note regarding our friend the Ospreys, who are taken on the chin. Recovering from the days of lost chicks due to DDT, they were starting to flourish and have their recover has dramatically reversed due to the lack of Menhaden. As a resident of the Chesapeake Bay region, I understand that the total menhaden population, a keystone species for the ecosystem of the bay, has likely been significantly overestimated (35-40%), and their numbers have actually been declining at quite an alarming rate. The upcoming studies that have been granted funding are great, but I fear the fish cannot wait for studies to be completed since they have been put off for far too long. In fact, I'm not sure why a temporary moratorium isn't on the table. Additionally, I have seen many osprey nests fail in recent years and I understand that the population in the bay area has fallen below the point of sustainability. This is heartbreaking to see after witnessing their recovery since the elimination of DDT. Scientists and naturalists that I know personally are seeing an alarming

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Thomas Statas	Maryland	Concerned stakeholder		As a resident of the Chesapeake Bay watershed, I have seen a decline in sport fishing catch and have seen many osprey nests fail in recent years to the point that the osprey population at the mouth of the Patuxent River is losing sustainability. This is heartbreaking to see after witnessing their recovery since the elimination of DDT. This time, scientists and naturalists working in the bay area that I know personally are seeing an alarming number of osprey chicks simply starving to death. It is long past time to reduce the annual menhaden catch to reverse this troubling trend. The birds and local fishermen simply cannot compete with mass scale commercial fishing using large destructive purse seine nets, which is another reason to limit the scale of the catch. In addition, it makes no sense that ~ 75% of the east coast quota goes to one state, Virginia. Why? Especially considering that a foreign company is largely the one who is profiting? It seems that a re-allocation of the entire east cost limit is also in order. Thank you for your consideration
Ed Palaszynski	Maryland	Other (please specify)	Very concerned citizen that realizes "everything is connected" and over fishing is disastrous for multiple reasons.	As mentioned already, over fishing in any area can be devastating for numerous populations that include humans and not just our wildlife. We are all connected and disruption and any ecological system can wreak havoc and lead to unintended consequences. While I appreciate the fishing industry and using our natural resources there is only so much to go around. It seems that we have entered another era of "everyone be damned and let us make our money". I would appreciate if the ASMFC seriously consider limits and save everyone involved and be smart in making this decision to limit harvests of the menhaden in the bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Charles Huber	Maryland	Concerned stakeholder		Atlantic menhaden are a keystone species for the entire Chesapeake Bay ecosystem. Over harvesting of menhaden has serious implications to the health of multiple species including Osprey and multiple fish species. Osprey are currently known to be struggling with reproduction issues due to lack of adequate food sources. Now is the time to act to protect Osprey populations and the overall health of the ecosystem.
Kevin McMenamin	Maryland	Private recreational angler		Atlantic Menhaden are the most important fish in the sea. Not only is it a primary forage species for many species and is also a significant filter feeder helping to improve water quality in the Chesapeake Bay. I believe that there is a localized depletion of Menhaden Biomass in the Chesapeake due the Hugh allocation of 51,000 MT to the VA portion of the Chesapeake. Please correct this long standing mistake. Thank You!
Eric Goodrich	Maryland	For-hire vessel owner/operator/crew		Atlantic menhaden should no longer be overfished in Virginia because they are a vital part of the marine ecosystem and support the health of the Chesapeake Bay. These small fish provide essential food for striped bass, ospreys, dolphins, whales, and other wildlife, while also helping sustain local fisheries and tourism. Reducing overfishing would protect the food chain, preserve biodiversity, and ensure that menhaden remain available for future generations. Virginia should promote responsible catch limits and sustainable fishing practices to protect this important resource.
Kevin Williams	Maryland	Private recreational angler		Business as usual is not an option but I do not want to see the Mehaden fishing industry decimated without incremental controls.
Stephen Brown	Maryland	Private recreational angler		But the Harvest by 50 percent

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Paul Wolfe	Maryland	Private recreational angler		Climate change, i.e. warming water in the Bay is having the biggest impact but since that is beyond the scope of this comment the best we can do is address the problems within your control. The overfished nature of the menhaden is the biggest thing that can be done in fisheries management for stripped and bay stock red drum. One company, one town, one type of fisher, nor one state own these fisheries, they belong to all of us. Everyone should have the opportunity to catch striped bass and that is just not happening in significant part because of one fishery is taking to much of the feeder fish population.
James Robbins	Maryland	Private recreational angler		Commercial fishing of Menhaden should be 100% banned permanently!
kevin m hoffman	Maryland	Private recreational angler		cut it by 50% or more

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
PAUL SAMUEL EMMART	Maryland	Private recreational angler		DATE: October 9, 2026 FROM: Paul Emmart RE: Atlantic Menhaden Draft Addendum II -- As a recreational fisherman, with 40 years in the Bay watershed, the exploitation of the menhaden is a serious concern of mine. I absolutely believe a Chesapeake Bay Cap Reduction of 50% cut is necessary for the industrial reduction fishery cap to prevent the loss of supporting fisheries for other fauna. I also support the Maryland Tidal and Recreational Fisheries Committee recommendation to restrict the reduction fishery to federal waters (outside 3 nautical miles). I completely support the theses presented by the Chesapeake Bay Foundation, Theodore Roosevelt Conservation Partnership, and the Coastal Conservation Association Maryland which advocate that menhaden are a foundational forage fish vital for striped bass, osprey, cobia, and marine mammals. They point to alarming osprey nest failures and starving chicks in the Bay as proof that industrial reduction harvesting is over-concentrated. When watermen themselves state that harvests are dropping from up to 10 million pounds down to about 1 million annually, it is time to cease the ravaging of the Bay. While Omega Protein / Ocean Harvesters has been primarily responsible for the mass casualty and over fishing, there must be a limit and strictly oppose any "roll over" of remaining capacity under the quota system. No roll over either in the season or the three piece cut of the season should be allowed. period. I appreciate the opportunity to comment and all of the important work that the Atlantic Menhaden Draft Addendum II represents. This has been a long time in coming and I hope that each person's input will be seriously considered. Best regards.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Greg kearns	Maryland	Other (please specify)	Non fishing biologist	strong support for Draft Addendum II to Amendment 3 of the Interstate Fishery Management Plan for Atlantic Menhaden. Specifically, I urge the Commission to implement a 50% reduction in the Chesapeake Bay menhaden reduction fishery harvest cap. As "the most important fish in the sea," Atlantic menhaden serve as the ecological foundation of the Chesapeake Bay. Allowing high-volume, industrial-scale reduction purse-seining to continue at current levels threatens the balance of the entire mid-Atlantic marine ecosystem. A 50% reduction in the Bay cap is an essential, science-based step forward for the following critical reasons: • Avian Predator Starvation & Osprey Population Crashes: The crisis facing the Bay's avian predators has reached a tipping point. Striking scientific evidence and widespread monitoring highlight unprecedented osprey nest failures across the Chesapeake Bay due to chick starvation. Ospreys rely heavily on menhaden to feed their young. The localized depletion of these fish by industrial vessels directly correlates with the heartbreaking crash of osprey reproductive success. • Protection of Critical Food Webs: Menhaden are a vital keystone species that funnel energy through the marine food web. They are a primary forage source not just for ospreys, but also for marine mammals like whales and dolphins, and economically vital finfish like striped bass (rockfish). We cannot rebuild struggling predator stocks without ensuring an abundant, localized supply of their primary food. • True Ecosystem-Based Management: While coastwide assessments may show the overall Atlantic menhaden stock is not officially overfished, coastwide data masks the localized depletion happening inside the nursery grounds of the Chesapeake Bay. The ASMFC must transition from managing menhaden solely as a commercial commodity to practicing true ecosystem-based management that accounts for localized ecological demand. • Support for Coastal and Recreational Communities: The Chesapeake Bay supports vibrant recreational fishing, charter boat, and ecotourism economies that depend entirely on a healthy, biodiverse ecosystem. Prioritizing a single, industrial reduction operation over the shared public resource of the Bay damages local communities and the broader multi-billion-dollar recreational economy. The warning signs are clear and mounting. The current harvest cap leaves the delicate food web of the Chesapeake Bay vulnerable to collapse. Cutting the

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Chris Wright	Maryland	Private recreational angler		For Issue 1 (Seasonal Allocation Text Box):"I support Option B3 paired with Option B for strict overage paybacks. However, I explicitly demand that the ASMFC prohibit the rollover of unused quota between seasonal periods. Allowing unused quota to carry over creates a loophole that permits industrial vessels to heavily concentrate fishing pressure later in the season." For Issue 2 (Chesapeake Bay Cap Text Box):"I support Option C1e for a 50% reduction to 25,500 mt. I strongly oppose Option C2a. A proportional, two-way linked cap acts as a Trojan horse that would automatically increase industrial netting in the fragile Chesapeake Bay whenever coastwide quotas rise. The Bay cap must be a hard, fixed maximum ceiling independent of coastwide model increases."

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Barbara Ripp Statas	Maryland	Other (please specify)	DelMarVa environmental photographer	Hello, As a Maryland resident, I am deeply concerned about the overfishing of menhaden, a keystone species, in the Chesapeake Bay region. I support both an overall reduction in the annual cap by 50% as well as a reallocation of the quota among east coast states. It is troubling that reports indicate the entire east coast population of menhaden has been significantly over estimated (up to 37%). With approx. 75% of the total catch currently going to Virginia, it's only logical that this has had an outsized impact on the Chesapeake Bay ecosystem. I have seen many osprey nests along the Patuxent River fail in recent years and the fledgling rate in the area around the Bay has fallen below the point of sustainability – while there are numerous factors, naturalists are reporting that the osprey chicks who have historically relied on their parents bringing in menhaden are starving. This is a tragedy after so many years of successful rebound. So, I also support the option for 3 equal length quota periods with a 25%/25%/50% spread to push a higher percentage of the catch beyond the osprey nesting period and to allow menhaden more time to work their way further up the Bay into Maryland. Sport and commercial fisherman also report a decline in the big fish that rely on the little fish for food. The birds and local fishermen simply cannot compete with mass scale commercial fishing using aircraft to locate schools of menhaden and large destructive purse seine nets, which is yet another reason to limit the scale of the catch in the Chesapeake Bay – not to mention that the majority of the profits are going to a foreign company! It is long past time to reduce the annual menhaden quota to help reverse these troubling trends! Thank you for your consideration! Barbara Statas
Penelope	Maryland	Concerned stakeholder		How about no overages? I tried reading the examples in the addendum a few times but they're all just "say the fishery goes over by 2000 pounds" but like, after the quota numbers are set, just don't do that? Going over should be impossible if the numbers are known, and punished if someone is taking too much intentionally. Having it roll over indefinitely doesn't seem as helpful.
James Manley	Maryland	Concerned stakeholder		Humans are #1 but we can do better than this carnage

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Nikki Gamer	Maryland	Concerned stakeholder		I am a Maryland resident and bird-lover and have followed the Osprey decline in the Chesapeake Bay through my local birding group. These birds are regal and magnificent to see populating our coastline. Every time I see one during my walks at Baltimore's Fort McHenry Park I'm reminded how lucky we are that these animals live among us. But if we don't do something urgently to reign in the harvesting of their primary food source--these birds will disappear under our watch. Please do the right thing for the birds and for the environment by reigning in the big businesses that prey on our natural resources for profit.
Fredric (Ric) Buckley	Maryland	Private recreational angler		I am also concerned about the by catch of the menhaden harvest. Is there any information or data regarding that. It seems that there must be a high mortality of other species, particularly game fish that feed on menhaden. I support any measure to reduce the menhaden harvest coast wide.
John Scheinman	Maryland	Other (please specify)	member of the Maryland Attorney General's environmental advisory counsel	I am not an expert, but I have followed this issue for years, and strongly support the reductions in take being advocated for.
Broc W Bowers	Maryland	Private recreational angler		I am strongly in favor of greatly decreasing the pressure of harvest on the menhaden. Especially with the main harvester of menhaden being a foreign company that has no regard for the effects of the harvest and its bycatch. I am strongly in favor of decreasing it as much as possible, and during revisits it being decreased more. The striped bass fishery is a staple of Maryland culture, and should be protected from something as obvious as over harvest from a foreign company, this should’ve been done very long ago.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kurt Long	Maryland	Private recreational angler		I am strongly opposed to Option C or any attempt to link the Bay Cap to the Coastwide TAC. Thank you for considering my preferences.
R. Loftus	Maryland	Other (please specify)	Former Oceanographic Research Scientest	I am totally against the over harveating or any harvesting of Alwife or Alwives in the Chesapeake bay. There should be a 'No Take' law imposed by MD. & VA. immediately !
Sara Szczurko	Maryland	Concerned stakeholder		I am very concerned about our ospreys and fish
Jeanette Louise Spangle	Maryland	Concerned stakeholder		I am very concerned about the effect of industrial reduction fishing of menhaden fish which is greatly affecting the survival of osprey in the Chesapeake Bay. Their reproductive rates have greatly decreased both due to fewer osprey eggs being laid and starving osprey chicks. The decline in menhaden fish is also adversely affecting the survival of other fish-eating birds in the Chesapeake Bay as well as other Bay wildlife (including other fish & marine mammals. These animals do not need to be endangered just to produce fish meal and dietary supplements.
John Erwin	Maryland	Private recreational angler		I am very upset that VA has decimated the fish population adversely affecting the Maryland economy and recreational fishing. Frankly, I think both the VA state AND the fishery should be sued by Maryland to recoup significant damages.
Peter Barren	Maryland	Private recreational angler		I am writing to highlight the critical role that abundant menhaden play in the Chesapeake Bay. Their presence is vital to the overall health and stability of the Chesapeake watershed and its broader ecosystem.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Megan Salerno	Maryland	Concerned stakeholder		Chesapeake Bay and its menhaden by supporting strong, conservation-minded reform through Draft Addendum II. Specifically, I ask the Commission to reduce the Chesapeake Bay Cap by 50 percent starting in 2027 (Section 3.1 Option C1e & Option C2a) and implement quota periods (Section 3.2.1, Option B2) to spread industrial harvesting effort across seasonal timeframes. Atlantic Menhaden are the backbone of the Chesapeake Bay. From an ecosystem perspective, menhaden are an indispensable, energy-dense food source for fish, birds, and marine mammals. They are the critical bridge connecting microscopic marine life to the striped bass on an angler's line, the osprey in their nests, and the mammals in our waters. From an economic perspective, menhaden provide essential bait for blue crab and lobster watermen across the Mid-Atlantic and power a $1.5 billion recreational fishing and marine tourism economy that sustains thousands of small businesses, charter captains, marinas, and hospitality jobs across the Bay. Research from the Center for Conservation Biology (CCB) delivers unequivocal proof that localized menhaden populations are severely depleted. This demands immediate regulatory action under Draft Addendum II. CCB studies demonstrate that osprey reproduction in the Chesapeake Bay has collapsed far below sustainable levels due to widespread chick starvation, specifically concentrated in high-salinity breeding areas where adult osprey rely heavily on menhaden for their diet. Controlled feeding experiments established a direct causal link: when starving nests in these high-salinity zones were manually supplemented with menhaden, chick survival was immediately restored to healthy levels. These findings prove beyond doubt that local menhaden stocks are being dangerously overharvested, and this overharvesting is putting the stability of the coastal food web, ecosystem, and economy at risk. Industrial menhaden harvesting profits a single, highly consolidated processing operation at the expense of the Bay's ecological health and the widespread economic well-being of our coastal communities. Establishing harvest caps and protecting menhaden populations is an essential investment in the financial stability and resilience of working waterfronts and in protecting the health of the wildlife that call the Bay home. The Bay can't wait any longer. Safeguarding the long-term health of the Bay requires fishery management decisions that prioritize ecosystem

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Patrick Crump	Maryland	Concerned stakeholder		I attended the Sept 15 hearing in Annapolis, and agreed with the vast majority of attendees who preferred a moratorium on menhaden reduction harvesting, to avoid further collapse of this keystone species.
Patrick Turri	Maryland	Private recreational angler		I believe the menhaden in the chesapeake bay and surrounding waters are being extremely overfished and is affecting the rockfish and other fish . I have fished the chesapeake bay for over 40 years and have noticed a dramatic change for the worse .
Mary dunlavey	Maryland	Concerned stakeholder		I don't know enough to answer most of the questions that deal with specific variables concerned with fishing limits or timing. I'm participating only to say that we have done something wrong to cause the Osprey to starve or vacate the eastern shore. We should know how to fix the problem we caused and do it.
Darin Crew	Maryland	Private recreational angler		I fish in Baltimore Harbor and work to improve water quality, I have seen the Menhaden fishery decline and with that the Striped Bass population. Harvesting Menhaden for pet food is outdated and needs to stop, instead of stopping ASMFC should apply a cull down of the menhaden reduction fishery. Thanks for your leadership on ecosystem management of this keystone fishery. My 2 children look forward to more menhaden and a healthier fishery
Philip Anderson	Maryland	Private recreational angler		I fish the chesapeake. I saw how we overfished the rockfish when I was young. I have watched the commercial vessels decimating the lower bay with their menhaden depletion. They must be stopped before the eco system collapses. SAVE THE BAY.
Jennie Bentz	Maryland			I grew up sailing and fishing on the Chesapeake Bay and continue to do so to this day. The only thing is in recent years - the fish are not plentiful, my recreational fishing hook remains empty, and the channel makers I pass along the way are empty of osprey. Please bring this Addendum II to fruition and make real efforts to implement commercial overharvesting and provide protection to Chesapeake Bay wildlife in and above its waters. Please do so for the wildlife and future generations who should know what its like to catch a fish in the Bay or see an Osprey capture its prey.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Charles Andrews	Maryland	Other (please specify)	recreational angler and wildlife observer	actively fishing and observing osprey and other wildlife for the 40 years that I have had this home. In addition, as my son resides in New York City, I frequently fish in New York harbor. I have not conducted a detailed rigorous scientific investigation, but my observations are such that I strongly recommend as a precautionary measure that the ASMFC significantly curtail menhaden take from the Chesapeake Bay and set seasonal limits on the allowed harvest to provide for abundant menhaden in time of critical need for ospreys. My empirical observations that support my opinion/conclusion regarding the options offered in Addendum II to Amendment 3 are the following: 1) My wife and I have been monitoring osprey nests and hatching success on Mill Creek for the past 7 years. We monitor approximately 30 nest sites. In the early years of our survey, almost all of the nest sites had young osprey's hatch and fledge, with over 40 fledging osprey in some years. For the past 4 years, the trend has been significantly downward with only 5 chicks hatching and 2 fledging this year. The maximum number of chicks at any nest was only one, when in past years several nests had three chicks. 2) In years past in the mid-summer and fall the creek in front of our home was full of menhaden schools and we frequently caught the fish with a throw out net for bait. The past three years, very few schools of menhaden, and this year only very small infrequent schools. Not able to catch any for bait. 3) I monitor the work of Greg Kearns at Patuxent River Park (Jug Bay), who has been observing and counting Osprey in the Patuxent River system for 40 years. He has recorded the amazing recovery of osprey following the phase out of DDT and now in the lower saline reaches of the river a significant decline in fledging chicks in the past four years. Intestinally, the decline in osprey in the freshwater portion of the Patuxent, where menhaden are not a component of the diet, has been significantly less than in the lower reach of the Patuxent River. As weather conditions in the upper and lower Patuxent are similar, this strongly suggests that weather/climate is not a dominant factor in the decline of osprey in the lower reaches of the river. 4) My fishing in New York harbor suggests that there has been a remarkable recovery in the fishery since purse seining for menhaden was curtailed in 2019. In the past two summers I have noted a amazing abundance of marine mammals and excellent fishing. This was not the

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
David Reeves	Maryland	Private recreational angler		was a boy and a teenager growing up in the Maryland Chesapeake Bay region in the 1960s and 1970s, I enjoyed fishing, boating, and water skiing in places near Annapolis, Deale, Saint Michaels, Easton, Oxford, and Cambridge. (I still do.) The bunker (menhaden) were plentiful in the open Bay, as well as the mouths of the Potomac River, Patuxent River, Choptank and other rivers, and along with them the schools of predator bluefish, rockfish. You could see the diving birds from a mile away and knew where the large schools of baitfish were being attacked under the surface by predator fish, roiling the waters. The ospreys had plenty of food to feed chicks, and dolphins had ample forage fish supplies to survive, too. The Chesapeake Bay ecosystem was robust and plentiful and healthy. Those were the days! Those days are no more. In the past several decades, I have witnessed a steep decline in the presence of schools of menhaden, and consequently in the predator bluefish, rockfish, and weakfish available for recreational anglers, in the Chesapeake Bay. The statistics support my anecdotal evidence, with continuously declining catch rates and landings in metric tons. While coastwide the Atlantic menhaden stock has been assessed as sustainable, for the past several decades the local mismanagement and local overfishing of the menhaden fishery in the Chesapeake Bay, a critical nursery habitat for many species, has been tragic. I would like for my children and grandchildren to be able to experience the Bay as it was when I was young. We cannot allow a foreign company such as Omega Protein to industrially mine and extract the Bay's menhaden as if they were a commodity. Menhaden are a natural resource and if managed properly and sustainably, a renewable resource for many multiple uses to enjoy as well as profit from, into the future. The single use, industrial extraction of menhaden by reduction fishery purse seiners, excludes all other uses of the Bay's menhaden fisheries: for pound-net fishers and recreational anglers, as well as for predator fish such as bluefish, weakfish, and rockfish, and also for healthy ecosystems supporting wildlife such as ospreys, dolphins, and whales. Please manage the Atlantic menhaden fishery, and the Chesapeake Bay menhaden fishery in particular, properly to rebalance the ecosystem and provide a healthy, abundant fishery to recreational, sport, and commercial reduction fishers, as well as predator fish such as bluefish and rockfish, and also for healthy ecosystems

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Wissel	Maryland	Private recreational angler		I have fished the Chesapeake Bay from the mouth of the Bay in Virginia to the upper bay for many years and there is absolutely no doubt that Menhaden aka the most important fish in the sea is lacking in abundance. Please take action, it's not just fish that depend on menhaden it's the entire ecosystem.
James Granahan	Maryland	Private recreational angler		I have fished the middle chesapeake bay since the 197Os and I have never experienced such a lack of gamefish than I have in the past few years. Spot, Croaker, Perch, Rockfish, Bluefish, etc just aren't here. I believe this is directly attributed to the virtually unchecked menhaden reduction fishery allowed in the bay and so close to the east coast shorelines. Something has to been done and if Virgina won't stop it than ASMFC needs to.
Amy Battaglia	Maryland	Private recreational angler		I have lived on the water on the Chesapeake for +22 yrs and pay close attention to the entire Bay ecosystem and the people who recreate & make a living utilizing Bay resources. To my knowledge no credible Scientific-based organization disputes the fact that the Bay resources are under severe pressure. Private citizens have voiced their concern over the repeated drop in fish take, osprey reproduction, and all acknowledge the keystone species role of the menhaden to the Bay. The mismanagement and the lack of political will stand in the way of meaningful steps to conserve and protect the Bay menhaden. Pushing a keystone fish to unsustainable levels is not justified based on needs of for profit entities. Taking action now to protect more of the menhaden population in the Bay is critical and long overdue. Yes, fund key research and set up reviews to assess the actions taken and whether they are effective. But further dithering in the face of overwhelming data demonstrating the harm to the Bay ecosystem is not in anyone’s interests.
Carl Tegen	Maryland	Concerned stakeholder		I have seen the Striped Bass fishery decline steadily over the past 13 years. I am told that insufficient Menhaden make into the Bay because of overharvesting.
Judy Stiles	Maryland	Other (please specify)	Osprey supporter	I have toured Jug Bay to learn about osprey a few times. Each year there are fewer chicks hatching and surviving. As osprey eat menhaden there need to be enough available to feed them. Allowing industrial fishing to deplete the fish population starves the osprey.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
BAYARD E GALEY	Maryland	Private recreational angler		I live and boat on the Chesapeake Bay in Maryland. Compared with when I was a kid, fishing in the Bay has become a complete joke. Cut the Bay reduction cap in half to 25,500 metric tons. Do not tie it to the coastwide quota. Spread the catch evenly through the season, make them pay back overages, and review the cap at least every three years.
Julia Alanen	Maryland	Concerned stakeholder		I live in a waterfront property on the Chesapeake Bay. My family and community watched the Osprey population dwindle and cease to thrive/reproduce in a startlingly short time frame.
James Anderson	Maryland	Concerned stakeholder		I live on the western shore of the Chesapeake in MD, and enjoy seeing the ospreys fishing while out on the patuxent, or other tributary rivers. I don't care if commercial fishing is cut to 0 in the Chesapeake, we need to protect the ecosystem and the creatures that depend on it.
H. Lars McCarter	Maryland	Private recreational angler		I live right next to the bay and spend several days a month on it recreationally. I've noticed a considerable reduction in the number of peanut bunker schools over the years and a drastic reduction in the number of adult bunker schools over the same period. Given the changes to natural mortality flagged in recent peer reviewed studies, I request ASMFC take appropriate action to address this apparent reduction in the stock to ensure long-term sustainment of menhaden throughout the bay. I want my children and future grandchildren the opportunity to experience a Chesapeake Bay full of natural life. It is our duty to protect and preserve it as well as the species within it. Let's not let politics, financial contributions, or the well-being of a few who profit from increased harvest of this species outweigh the well-being of the many. Moreover, it is in the best interest of local, state, and the federal economy to ensure long-term sustainment of the resource vs near-term reduction.
Emily Hansroth	Maryland	Private recreational angler		I strongly urge you to enforce strict limits on menhaden and other critical bay fish species. As a waterfront resident and recreational fisher, I have observed sharp declines in successful osprey nests and diversity of fish species over the past 5-6 years. More needs to be done to protect the diversity and health of this critical ecosystem.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jesse Howe	Maryland	Private recreational angler		I support taking meaningful precautionary action to reduce and better manage the industrial reduction harvest of Atlantic menhaden within Chesapeake Bay. Menhaden are an essential component of the Chesapeake Bay ecosystem and an important forage resource for recreationally and ecologically important predators. Given the concerns that prompted Draft Addendum II, I support the maximum 50% reduction in the Chesapeake Bay reduction fishery cap. I also support measures that distribute harvest more evenly throughout the fishing season rather than allowing intensive harvest to be concentrated during the spring and summer. The Chesapeake Bay deserves a management approach that recognizes its unique importance as nursery and feeding habitat and prioritizes a healthy, abundant forage base. When uncertainty exists about localized ecological impacts, precaution should favor the long-term health of the Bay and the many fisheries and species that depend upon menhaden. Please adopt the strongest conservation options available under Draft Addendum II. Thank you for the opportunity to comment.
June Bourdat	Maryland	Other (please specify)	Bird population, osprey, dying	I understand you are concentrating on fishing, but there are other environmental repercussions. Such as the birds have been dying of starvation.
Jennifer L. Boyer	Maryland	Private recreational angler		I urge the Commission to adopt the conservation-minded management measures outlined in Draft Addendum II to protect Atlantic menhaden and the Chesapeake Bay ecosystem that depends on them. Menhaden are a vital link in the Chesapeake Bay food web, providing essential nourishment for ospreys and other wildlife while supporting the ecological health of the Bay, the livelihoods of local watermen, and the joy of all of those who live near and spend time on the Bay. Concerns about osprey chick survival, declining bait catches, and inadequate Chesapeake Bay-specific menhaden science highlight the need for a precautionary approach to management. Thank you for considering my comments. Respectfully, Jennifer Boyer

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jerome Ries	Maryland	Private recreational angler		I would even like to see a ban of 3 miles off the coast
Dr. Earl Chambers	Maryland	Other (please specify)	Biologist and life time supporter of data driven environmental causes.	I would say the the best solution is to work with Virginia and allow for the slow transition of this industry to offshore purse seining. The delicate nature of the bays ecosystem should be taken into account and seasonal closure of the reduction industry during May and June allows for a very sincere effort to reverse the cause and effect of this industry. The negative findings are many and can be considered data driven enough to make a revision to the Addendum. Earl Chambers
Warren A Meny	Maryland	Private recreational angler		I would stop harvest completely till game fish stock is on the mend.
Robert	Maryland	Other (please specify)	Nature enthousiast	I've selected these options for the least fishing but in actuality want no fishing, for the sake of the menhadens. You can also note that the Commission should consider the interests of all and not solely those who fish.
chris vassallo	Maryland	Private recreational angler		If reallocation becomes an option. I choose no reallocation. The bottom line is that menhaden are overfished and the cut should be made. Moving it to another area does not solve the problem.
Joal Barbehenn	Maryland	Private recreational angler		I'm a long time boater and fisher in the Chesapeake Bay and Atlantic region. I have seen a large decline in Menhaden populations and believe we owe a duty to the environment and future generations to drastically reduce harvest levels immediately.
Tim Tinker	Maryland	Concerned stakeholder		I'm glad that Menhaden overfishing is being addressed!
Blake Freeman	Maryland	Private recreational angler		I'm hoping to see an increase in the wildlife that depend on this food source.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Peter Thornton	Maryland	Concerned stakeholder		I'm sorry for the folk in Reedville, but they saw this coming - it's been debated for years. Some will have to relocate and find a different job.
Dave Boyden	Maryland	Private recreational angler		In actuality menhaden commercial fishing I. The Chesapeake bay should be eliminated. Improving recreational opportunities and sport fishing will generate more income to the local economies than commercial menhaden fishing.
Thomas Clinch	Maryland	Private recreational angler		In my mind, the entire industry should be SHUT DOWN
Brian Shumel	Maryland	Private recreational angler		It has been an outrage to take so much of the Menhaden quota from one part of the area. This is overdue
Samantha	Maryland	Concerned stakeholder		It is fairly obvious to anyone who is a birder that the osprey population is in danger. In the past three years there has been a sharp decline in breeding pair success. For years scientists have been saying its from the menhaden. Please let's fix it before the osprey in the chesapeake bay are extinct!
Nancy Suniewick	Maryland	Concerned stakeholder		It is imperative that industrial harvesters significantly reduce the amount of menhaden they take. Imperative!
Julia Hoyt	Maryland	Other (please specify)	concerned citizen who lives near and deeply cares about the Chesapeake Bay	It is very clear that Menhaden have declined and Chesapeake wildlife is suffering from this. It is our responsibility to assure that the Chesapeake and the wildlife that relies on it be kept healthy and available for all, human and wildlife. Thank you to all who have worked so diligently and passionately in striving to accomplish this goal.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
John Conolly	Maryland	Private recreational angler		It's time for Omega Protein to cease menhaden operations in the Chesapeake Bay and along the Atlantic coast within 3 miles. I realize it is a couple hundred jobs in Reedville VA but the health of the bay and the economic value of protecting these fish far exceeds the Reedville operation. It's in the hundreds of millions annually when you consider all of the recreational aspects associated with the bay. When will Virginia realize that Omega has the VA politicians in their pocket and do something to protect the environment? These fish promote a cleaner bay and are the primary food source for healthy fish and bird populations. Scientific studies have shown serious decline in osprey recruitment and the main contributor is a lack of menhaden. Omega already cannot catch their cap so least realize what is going on in the environment. Also, any leftover cap should not roll over to subsequent periods.
Mark Louzon	Maryland	Private recreational angler		It's understood only VA allows commercial harvesting of menhaden. With the drop in rockfish and osprey numbers, why would VA allow this? In my opinion, shut down commercial menhaden harvesting in the Chesapeake Bay completely over the next 3-5 years. Maybe even more quickly.
Joseph McGurrin	Maryland	Private recreational angler		It's ridiculous that an industrial scale fishery of this size is allowed at all. My comments above reflect that there is no option to eliminate the Bay industrial fishery at this time. The idle threats of Omega Protein and it's owner about leaving Reedville are a bluff that shouldn't be taken seriously. There will be no loss of local jobs if the Bay portion of their huge harvest is eliminated. They're making a fortune now and there is no other Atlantic state thtthat would allow their processing facilities within their borders. Shame on the state of VA for allowing this archaic and destructive Chesapeake Bay fishery to continue to exist!
Scott Sebastian	Maryland	Private recreational angler		Leave the fish alone !! No harvesting. Other species need them to survive.
Peter Arrabal	Maryland	Private recreational angler		Limiting menhaden harvesting is essential to overall Bay environmental health

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Alex	Maryland	Concerned stakeholder		Make everyone have to follow this law and actually ensure that these regulations are being enforced
Robert Cannon	Maryland	Private recreational angler		Men Haden filter the Bay and provide food for many species of fish; both of which seem to be needed.
Bird Cord	Maryland	Private recreational angler		Menhaden are a important part of Chesapeake bay and we need to protect it for the future
Thomas Guarino	Maryland	Private recreational angler		Menhaden are being overfished and the entire ecosystem is being harmed from that. The fish reduction industry is destroying the resource and everyone is being negatively impacted. Please reduce the TAC and also distribute it to waterman as well.
Gabriela Wikar	Maryland	Concerned stakeholder		Menhaden are the base of our entire aquatic fishery. Without their biomass as a food scource our fisheries are failing. The combination of overharvesting and warming oceans is impacting fish migration and spawning behaviors. Limiting menhaden harvest has been under discussion for decades, detrimental impacts have become unavoidable. We must take action before it is too late.
mark cascia	Maryland	Private recreational angler		menhaden have all but disappeared in the upper Chesapeake
Wayne Bierbaum	Maryland	Private recreational angler		Menhaden have almost vanished in the upper Chesapeake and strict restrictions are needed to improve the health of the bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Tobias Pessoa Gingerich	Maryland	Concerned stakeholder		Menhaden populations in the Bay are becoming critically low, and watermen, predatory fish, and ospreys that rely on them are all struggling. The prospect of more extensive study to confirm links between these circumstances and the reduction fishery in Virginia is encouraging, but should not be used as an excuse for inaction. We're experiencing problems from low menhaden populations now, and even without before we get further research, there's good reason to believe that the massive harvests by the reduction fishery are at least one major cause. There's no reason to believe that reducing them will make the problem worse. I strongly encourage the Atlantic States Marine Fisheries Commission to reduce the Bay Cap on menhaden harvest by at least 50%. The status quo is not acceptable. Without meaningful action, we risk lasting, possibly irreversible damage to other fishing and outdoor recreation industries in the Bay, and to the health of the Bay ecosystem itself.
John Wick	Maryland	Private recreational angler		Menhaden populations must be strictly maintained for the sustainability of our fisheries. A smaller harvest amount will allow for watermen to still keep themselves afloat while keeping our fisheries healthy.
Milford H. Marchant Jr.	Maryland	Private recreational angler		Menhaden serve as a keystone species for the Chesapeake Bay ecosystem. Their health and abundance affects everything from fish and Osprey to water quality. Implementing responsible fishing practices will help to preserve their presence and prosperity within the Chesapeake Bay, so that the ecosystem as a whole can thrive and flourish.
Jimmy Deriu	Maryland	Private recreational angler		Menhaden support the entire bay ecosystem and reduced harvest is a very sustainable choice to support the future economy of the bay as well as its nature beauty.
Brad Ruby	Maryland	Private recreational angler		My family has fished the Chesapeake for years. We've watched large commercial companies strip the baitfish that rockfish feed on. Fishing the southern Bay, we simply watch the Omega vessels take and take. A healthy balance is needed so commercial and recreational users can both succeed. The ecosystem is being harmed, and every angler — commercial or recreational — will tell you the same.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert Frantz	Maryland	Concerned stakeholder		My first preference is not among the options: I support a 100% reduction of the Chesapeake Bay reduction fishery cap — full elimination of the industrial reduction fishery inside Chesapeake Bay. Because that is not offered, I have selected Option B4 (50% reduction, 25,500 mt) as the deepest available cut, and I ask that it be implemented in a single step rather than phased in, and that the Board initiate the amendment or adaptive-management process needed to phase the Bay reduction fishery out completely on a defined schedule. If the Board instead links the Bay Cap to the coastwide TAC, my preference is Option C1E (13.6%) paired with Option C2B, the lowest upper limit offered. I oppose Options C2C, C2D, and C2E, which would permit a Bay Cap of 75,000-87,216 mt — far above current harvest — at the very moment the Bay's predators are failing. Reasons: menhaden are a keystone forage species and filter feeders that improve the Bay's clarity and water quality. The Center for Conservation Biology reports 2026 was the worst osprey breeding season ever recorded in the Chesapeake, 0.25 young per pair in waters above 5 ppt against roughly 0.8 needed for stability, with 81% of pairs fledging nothing, and menhaden delivery to nests down more than 80% since the 1980s. Striped bass remain overfished with a 2029 rebuilding deadline. The Bay Cap is 27.3% of the entire coastwide TAC and was never set from any ecological assessment, only from 2012-2016 landings. On timing, I selected quota period Option B2 because ospreys need abundant fish in April through June and cannot shift their breeding chronology; overage payback should be mandatory so the periods actually bind. I also support coastwide reductions of at least 50% from current levels. A detailed letter with sources has been submitted separately by email to comments@asmfc.org.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kennon Smith, J.D.	Maryland	Concerned stakeholder		menhaden as well as the species and communities dependent on a healthy menhaden population. The Chesapeake Bay is changing and showing increasing signs of stress—protecting menhaden is one of the few ways we can help this struggling estuary. I would greatly appreciate you considering my additional comments on Draft Addendum II. I am a federally licensed bird bander, and I have been banding birds of prey in MD, VA, and WV since 2004, and osprey nestlings in the Chesapeake Bay watershed since 2016. In past years, I have banded as many as 39 osprey nestlings in a season, at nest sites on MD and VA tributaries. In recent years, those numbers have steadily declined and many nestlings have perished from starvation while in the nests and prior to fledging. In 2026, I banded only 5 nestlings and 1 of those perished prior to fledging while in rehab care because of low body weight. I have also observed a trending change in the diet of the osprey, that is, a change in the prey fish species brought to one nest in particular that is monitored by a live camera. In 2026, 55% of the prey fish brought to the nest were non-native species, with 35% being goldfish, 16.7% blue catfish, and 3.3% Common Carp. Only 6.7% were Atlantic Menhaden. The new dietary "normal" caused by industrial overfishing and reduction fishing of Menhaden in the Chesapeake Bay has reduced the reproductive success of the Chesapeake Bay ospreys below sustainable population numbers. With respect to the Chesapeake Bay ospreys, we are already at a tipping point, or beyond. While I support the Chesapeake Bay Foundation's comment letter, especially with respect to reduced take during fish spawning migrations and osprey nesting seasons, I believe an IMMEDIATE BAN on industrial and reduction fishing of Menhaden in the Chesapeake Bay is fully warranted. The Total Acceptable Catch of Menhaden should be filled from Atlantic coastal waters and NOT from the Chesapeake Bay and it's watershed tributaries! Reductions on industrial and reduction fishing in the Chesapeake Bay are at least 3 years overdue. The Commonwealth of Virginia has extensive Atlantic coastal waters from which to take Menhaden. An immediate ban or pause will just be the beginning of a long healing process for many Chesapeake Bay species and for waterman, sportfishing charter boat owners and anglers, and restaurateurs who have seen the funded testing and regulatory protections can kicked down the road for far

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert mcconnell	Maryland	Private recreational angler		N/a
Mary Yancey	Maryland	Concerned stakeholder		Natural resources are no match for human ingenuity and technology unless we pair our harvesting with sound and wise limits.
Simeon Lee	Maryland	Private recreational angler		No short term resource collection and therefore benefits are worth the depletion of a fully functioning and diverse Chesapeake system. This bay is one of the aquatic wonders of this country - how little would future generations regard it if we continue to reduce its species?
Darren Stimpfle	Maryland	Private recreational angler		No thank you
Maria Briggs	Maryland	Other (please specify)	Just enjoy walking on the beaches near the Chesapeake Bay!	No thank you!
Philip Lienesch	Maryland	Private recreational angler		none
Brett Schrader	Maryland	Private recreational angler		OMEGA needs to leave inside the CBBT, they are ruining our Eco system in the upper Bay. Follow the money trail to VA politicians for the pay offs.
Stephen Fredrick	Maryland	Private recreational angler		Osprey and Rockfish populations have experienced significant reductions. The Menhaden harvest needs to be drastically reduced

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Carole Engels	Maryland	Other (please specify)	Concerned citizen of the Chesapeake	Osprey need menhaden to feed their young. They are dying.
Ashley Westbrook	Maryland	Other (please specify)	Environmentalist, boater	Our family has been boating and living along the Chesapeake Bay for more than 20 years and we have a deep connection to the waters and ecosystems of this area. As the largest estuary in the United States, the Chesapeake Bay is a critical breeding and nesting ground for many land and water species along the entire eastern seaboard. While I understand there are many environmental stressors the Bay must endure, the massive harvests of menhaden is a contributing factor to the decline in critical species such as the osprey and striped bass. We have an osprey nest at the end of our dock and this summer was the first time in more than ten years the osprey offspring did not survive. While this is anecdotal, it is consistent with other data which shows widespread osprey productivity declines. I believe it's in part due to a lack of small menhaden in the late spring when they are needed by the osprey to feed their hatchlings. The osprey are starving. In the late spring/early summer, we used to see large schools of menhaden in the waters off our dock, but this year they did not come until late in the summer, after the osprey chick(s) had died. These declines signal an URGENT need for precautionary conservation practices NOW. Industrial reduction fishing extracts over 100 million pounds of fish in a concentrated summer window, harming the local food web and depriving other groups, especially watermen and anglers, of fair access. We urge fishery managers to implement strict quota periods that will distribute the harvest evenly across the year rather than allowing an intense summer harvest. While I agree with the need for a broader study that has been funded by the state of Virginia, we cannot wait for the results to take action. We must limit the menhaden harvesting as much as possible NOW and once the results of the study are available, a more permanent plan can be determined.
Bri	Maryland	Concerned stakeholder		Our osprey are relying on your action

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jocelyn Tuttle	Maryland	Private recreational angler		Our ospreys, marine mammals, and other Bay species need a healthy menhaden population. Water quality and loss of habitat are already an issue for menhaden so please take action to protect this keystone species for ALL.
Jamie Wu	Maryland	Private recreational angler		Over the past few years we have noticed a significant decrease in the menhaden found in the middle and upper Chesapeake Bay, and it has affected the fisheries for Rockfish, Cobia, Redfish, and crabs. I am tired of seeing the fishing boats harvesting the menhaden, and disrupting the Bay's ecosystem.
Tom Ripp	Maryland	Other (please specify)	Maryland resident who wants to protect the environment and other species	Overfishing is adversely impacting wildlife around the Bay. We need to adopt restrictions that limit our adverse impact on the environment and other species. Why should there be any rollover of underages at all? Let the fish population recover. A healthy environment and protection of wildlife is more important that healthy profits of a few businesses/corporations/foreign corporations.
HENRY LILLY	Maryland	Private recreational angler		overfishing of menhaden appears to be a continual issue with menhaden not adequately reaching maryland section of pay leading to lack of adequate food for fish and osprey in region

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Susan Palaszynski	Maryland	Other (please specify)	concerned citizen alarmed at the higher and higher number of osprey chicks that die due to reduced menhaden in the Chesapeake Bay	Overfishing of menhaden is taking a very destructive toll on the birds and other species in the Bay that rely on this rich food.
Marty Stipe	Maryland	Private recreational angler		Please be proactive to save the ecosystme before it gets any worse. Thank you
Wayne	Maryland	Shore-side support industry (e.g., bait and tackle shop owner, boat retailer)		Please do something before it is too late.
Randy Deltuva	Maryland	Private recreational angler		Please do something for real this time.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Dan Murphy	Maryland	Private recreational angler		Please do whatever it takes to protect this vital resource from commercial exploitation. The menhaden are a crucial forage fish for many of the game species in the Bay and they will not survive without them.
Daniel S Tang	Maryland	Concerned stakeholder		Please give the osprey a chance. We are losing our precious wildlife at an alarming rate. We want to see the birds and we want to see wildlife thriving.
Andrew Shaffer	Maryland	Private recreational angler		Please help the bay and the wildlife!
Paula Williams	Maryland	Other (please specify)	Concerned bird lover	Please help the birds. Time is running out. Do it now before it is too late.
David Felber	Maryland	Concerned stakeholder		Please protect our natural resources. Thank you.
Anslie Baxter	Maryland	Concerned stakeholder		Please put the Health of the entire Chesapeake Bay above corporate profits
Larry Hooper	Maryland	Private recreational angler		Please save the bay!! The lack of Menhaden is destroying the whole ecosystem. DO SOMETHING ABOUT IT!
Kris N Higdon	Maryland	Concerned stakeholder		Please take all measures to save the Osprey and conserve their food source.
Carey Rowsom	Maryland	Concerned stakeholder		Please take the necessary measures to protect the Chesapeake Bay ecosystem. Massive harvesting of menhaden doesn't just affect osprey- they are the "canary in the coal mine". There has to be a better way to keep jobs, but, also keep a healthy supply of feeder fish. We are looking at devastation of the food chain within the bay for many organisms. Humans won't escape the end result if we ignore the problem.
Bob Atlas	Maryland	Concerned stakeholder		PLEASE tighten the rules as much as possible. What's happening now is a perfect example of privatizing gain and socializing loss. Though in this case the burden of the loss is borne by helpless creatures.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Anthony Feurer	Maryland	Private recreational angler		Please top over fishing the fish that the rest of the Chesapeake Bay needs to exist.
Lawrence Hooper	Maryland	Private recreational angler		Please, please, please lower the catch limit on menhaden. The drastic reduction in their numbers due primarily to overharvesting is crippling the species that need them to thrive. Plus, the bycatch too often kills shad, whose numbers have plummeted over the past 40 years and need to be carefully protected if they ever are to return in numbers.
Ron Stierstorfer	Maryland	Private recreational angler		Protect the bay please.
Rosa Hance	Maryland	Other (please specify)	Bird-watcher, occasional recreational fishing	Question 8 seemed to be suggesting that the caps/quotas were all around 33% which was not the 50% that I would want year round. There is a critical imbalance of the ecosystem happening now and a slight reduction in harvesting is not going to cut it for resolution.
Helen Griffith	Maryland	Private recreational angler		Reduce the mehanden harvest to preserve the environment.
Stuart S Rienhoff	Maryland	Private recreational angler		Reduced menhaden populations due to the rendering industry impacts the Bay recreational and charter boat industry as well as water quality and conservation efforts. Not as easy to measure as the reduction industries economic impacts but significant.
JEFFREY STEVENSON	Maryland	Private recreational angler		Request that all in-Bay VA harvest be put on a stop now and through 2027, to enable full stock study and scientific review.
Tim Campbell	Maryland	Private recreational angler		Save the bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Anthony Yakubovich	Maryland	Concerned stakeholder		Save the birds
Frederick C. Menage	Maryland	Private recreational angler		SAVE THE CHESAPEAKE BAY! Stop the menhaden netting and let Mother Nature's filter feeders help to clean up the water by straining plankton and converting the sun's energy into fat and protein to fuel predators up and down the bay.
Scott Sadler	Maryland	For-hire vessel owner/operator/crew		Shut all menhaden fishing out of the bay!
William Sistrunk	Maryland	Private recreational angler		Shut the whole thing down. Foreign companies are damaging the bay and ocean ecosystem. End all harvesting until a real recovery is proven.
Richie	Maryland	Private recreational angler		Something needs to be done quickly to bring back the bay's ecology balance.
Paul Serino	Maryland	Private recreational angler		Spreading harvest more evenly across the season directly addresses the concentration of effort concerns the Draft Addendum identifies. Even setting aside the overall cap level, distributing effort reduces the risk of short term forage gaps that can affect feeding predators and the anglers who depend on healthy predator populations.
Matthew Clark	Maryland	Private recreational angler		State and federal agencies need to drastically cut or entirely eliminate the harvest. The commercial fishing operations are quite literally going to collapse the bay ecosystem. Weird how Ospreys are starving. It's quite clear the over harvest is destroying everything. Government's job is to check and prevent ecological destruction. Please take on that role.
Ryan Gormley	Maryland	Private recreational angler		Stop taking the bottom of the food chain away from the bay

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Donald E. Wilhide	Maryland	Private recreational angler		Stop the harvest of menhaden in the Chesapeake Bay
Giovanni Coratolo	Maryland	For-hire vessel owner/operator/crew		Stop the industrial harvest of menhaden 100% within the 3 mile limit in the ocean and the bay. I have fished the bay for over 65years and the my personal experience indicates that the decline of menhaden has been dramatic over the last 20 years destroying the ecosystem of the bay and surrounding areas.
Tommie Powley	Maryland	Private recreational angler		Stop the over harvesting of menhaden by a single corporation. Commercial Watermen's livelihood have been ruined. The recreational fishinging industry has been adversely effected and heading in the wrong direction.
Don Reithlingshoefer	Maryland	Private recreational angler		Stop the useless slaughter for the health of the striper bass !
Patricia A. Hansen	Maryland	Other (please specify)	Citizen scientist - ornithology, ecology	Suggest a phased-in approach to achieving 50% reduction of Bay Cap: TAC (sub-option C1e) to mitigate/soften possible negative impact on fishery employment figures. No specific suggestions on overall length of the phase-in or intermediate targets/timeframes, just that there be an immediate lowering to 10% in Bay Cap: TAC and that the time to achieve 50% not exceed three cycles of revisiting the Bay Cap.
Scott Coleman	Maryland	Concerned stakeholder		Thank you for listening!
Brian Scharle	Maryland	Private recreational angler		Thank you for the opportunity to comment and I hope future menhaden management decisions are based on ecological factors and, when in doubt, quota caps are set on the conservative side as a precaution.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Mary Finelli	Maryland	Concerned stakeholder		Thank you for your attention to this grave issue. This response is submitted on behalf of Fish Feel's many supporters in the mid-Atlantic and those beyond it. What happens in the Chesapeake Bay affects us all. This is especially true considering the migratory nature of menhadens and many of the animals who depend on them. The options chosen in this response were selected only because they are believed to be the best ones the survey offers. In actuality, all fishing for menhaden should be disallowed. In addition to the immense cruelty of fishing -science has shown fishes to be sentient animals who can suffer fear and pain- menhaden is a keystone species, and the Chesapeake Bay is a nursery for many species that rely on these fish. Scientific evidence indicates several of these species are experiencing serious population declines which are believed to be caused by the decline in menhadens. Allowing these fish to be caught for use -by a foreign company, no less- as food for farmed fishes (fish farming being grossly inefficient, inhumane, and environmentally detrimental), as fish oil supplements (omega fatty acids can easily be obtained from sources other than fish), as fertilizer, or for "recreation," is a great disservice to menhadens, to the animals who depend on them, to the ecosystem(s), and to the vast majority of people who do not benefit from such cruel and wasteful exploitation but instead want wildlife protected. The Commission should take into consideration the interests of all and not solely those who want to catch/kill wildlife. While other factors may be deleteriously impacting the menhaden population, reducing fishing -ideally to zero- is the sole way the Commission can help it. The precautionary principle is key to good management. Thank you again for your attention, please give our concerns due consideration. Mary Finelli, President, Fish Feel www.FishFeel.org
Hal Ivey	Maryland	Private recreational angler		The "available" options offered here don't begin to address the REAL decline in bunker. Reduction fishing should be cut by 90% or more in the Chesapeake. You clowns need to come live on the water and see just how barren it is of the forage that all predators need to thrive. The Bay is the Bunker nursery just as it is for predator species. Current decimation of the Bunker schools in the Bay is destroying their ability to recruit properly.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Evan Dintaman	Maryland	Private recreational angler		The ASMFC has demonstrated over the years (in many species) that is values private, commercial profits ahead of environmental concerns and species conservation. The ASMFC board needs to stand up for our natural resources and be bold in the face of strong lobbying and private, for-profit industries. The ASMFC has a chance to make or break public trust with this decision and it is important to listen to the overwhelming public comment and act in the best interest of our environment and fisheries.
Ryan Kozel	Maryland	Concerned stakeholder		The Atlantic Menhaden is as pivotal to the health of the entire bay, and therefore the entire watershed, as any individual species. More than just osprey have suffered from the massive overharvesting allowed to happen in Virginia, and even worse will happen if immediate measures aren't taken. 50% should be just the beginning of the conversation, this company pillages the most important natural resource in the bay and make a fortune on it. Meanwhile everyone who lives on and around the Bay suffers for it. I strongly urge enacting the cap
jack Meyerhoff	Maryland	Concerned stakeholder		The biggest problem is not so much the Bay (yet a cut back will determine the future of Menhaden) catch limits; but the absurd giant catch limits that the largest net hauling company and it's one subsidiary currently have. Omega Oils should NOT be permitted to lobby for greater sized catches and the Menhaden catch and bycatch should be reduced by more than 100 metric tons for a positive rebound to occur in the fish (rockfish) and birds (osprey)
Hans Vandenbosch	Maryland	Private recreational angler		The Canadian company is strip mining our waters of a valuable food supply for most other species which are depleting like striped bass
Dylan Taillie	Maryland	Private recreational angler		The Chesapeake Bay Cap should be revisited to insure other species that depend on menhaden for their livelihoods have the access to menhaden they need to thrive. Menhaden are far more important to the ecosystem than to humans as dog food and omega 3 capsules. Menhaden should be valued according to their impact on game fish and anglers, which outsizes their value as it is currently calculated as a reduction fishery.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Martin J Etzel	Maryland	Private recreational angler		The commercial harvesting of menhaden does little for the citizens of MD & VA compared to the massive benefits of allowing the menhaden to thrive in a much less aggressive catch
Andy Myers	Maryland	Concerned stakeholder		The current over harvesting hurts everyone using the bay and needs to be reduced.
Daniel Somes	Maryland	Private recreational angler		The decimated population is destroying the ecosystem and the fishery. Do you actually care about the bay or the money you get from commercial fisherman?
Jay Butler	Maryland	Concerned stakeholder		The ecology of the bay is in crisis, and has been for years. Harvesting of menhaden to provide food for fish farms (or sny other use) should not be allowed. The few people employed in this work can find other work. Transitional benefits can be provided, but that's beyond the scope of this regulation.
Steve Doctor	Maryland	Private recreational angler		The harvest is being monitored as weight of landings. The size of the fish being harvested in the bait fishery has diminished greatly. A large percentage of the fish being caught in the bait fishery in Maryland are less than 200 mm (I don't know if size is being monitored in the reduction fishery) and are age one with a much smaller size than in historical times. While the weight of fish harvested hasn't declined substantially, the number of fish being harvested has increased substantially. A much greater biomass of fish could be harvested if the fish were allowed to develop to maturity, which could be accomplished by not harvesting them in the nursery area- specifically the Chesapeake Bay. This would also have the benefit of increasing the spawning stock biomass. My recommendation would be to eliminate reduction harvest in the Chesapeake bay entirely and allow the reduction fishery to operate only outside of three miles allowing the juvenile menhaden more time to develop into adults.
Lisa Kuennen-Asfaw	Maryland	Concerned stakeholder		The health of the menhaden population in the Bay affects every Marylander, not just those in fishing related occupations. We cannot control every impact on our bay but we can control how much we harvest. Thank you for allowing my input.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kurt Schwarz	Maryland	Concerned stakeholder		The impact of the current limits on the Osprey population in the main stem and lower Chesapeake Bay is evident. Ospreys cannot maintain breeding in the area, as they depend on menhaden, which are clearly not abundant enough to support nesting Ospreys. Stripe Bass are also down in the Bay and also depend on menhaden. Maryland closed the Striped Bass fishing season for the month of August, to hopefully boost their population. Clearly the lack of menhaden is impacting that fishery.
Stephen Aubrey	Maryland	Private recreational angler		The industrial menhaden harvest in the Chesapeake Bay must be cut in half to protect the foundational forage base of the coastal food web. Localized depletion of menhaden in the Bay is having severe downstream ecosystem effects, including the starvation of osprey chicks and declining catches for local charter captains and watermen. Strict, enforceable seasonal quotas are critical to prevent industrial fleets from concentrating their extraction during the sensitive spring and summer months when predators rely on menhaden the most. The ASMFC must prioritize leaving more menhaden in the water to sustain healthy populations of gamefish, marine mammals, and birds over maximizing industrial reduction yields.
Chloe Herman	Maryland	Other (please specify)	Concerned citizen	The language of this survey is unnecessarily opaque and discourages regular people from weighing in on matters that affect our ecosystem.
Dennis G Burton	Maryland	Private recreational angler		The menhaden catch should be reduced by at least 50%, the lack of bait fish is destroying the fishery in the Chesapeake bay, thanks for your assistance, Dennis Burton
Sean George	Maryland	Private recreational angler		The Menhaden population is extremely important to the local ecosystem of the Bay and it has become abundantly clear that without stricter limits and rules, the fisheries and business sector will happily hunt them to disastrously low population levels.
Michael Pochettino	Maryland	Private recreational angler		The Menhaden Reduction fishery provides benefit to the few at the expense of the many when it comes to the economic and quality of life benefits provided to the Maryland and Virginia by the Chesapeake Bay. It is time to start managing it as such.
Carolyn Troiano	Maryland	Concerned stakeholder		The Osprey population in my area has decreased dramatically. I don't want to hurt the fishermen nor harm their livelihoods but something has to change. Save the Bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
David M Butler	Maryland	Private recreational angler		The overfishing has drastically reduced the forge. Fish menhaden much to the detriment of the entire Chesapeake Bay: rockfish, osprey , all manner of species please, if I were king, I would cut out the reduction fishery. And while I'm talking stop the commercial harvest of rockfish.
Freddi Weiner	Maryland	Other (please specify)	concerned citizen	The overfishing you have allowed is throwing the ecosystem into disarray and killing other species. It is incomprehensible that you have allowed this situation to occur Please rectify this
David L. May, Sr.	Maryland	For-hire vessel owner/operator/crew		The Reduction Fishery has taken its toll on the Maryland portion of the Chesapeake Bay over the past 4 decades I have been fishing it. Please either reduce or ban the Menhaden harvest in the entire Chesapeake Bay. A foreign owned company should not be able to rape this valuable resource.
Thomas Simpson	Maryland	Other (please specify)	Recreational angler with fisheries concerns but current major concern is rapid decline in Osprey nesting success that may be linked to menhaden decline.	The reduction in menhaden stock clearly has impacts on important fish species. The recent decline in osprey nesting success appears to correlate with the decline in menhaden numbers and menhaden is a major (primary?) food source during their summer nesting season in the Chesapeake Bay region. While more data/research would improve understanding of the menhaden-osprey decline relationship, there is enough knowledge to know the importance of menhaden to osprey to protect osprey while also protecting key fishery stocks.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Daniel Raymond Weber	Maryland	Private recreational angler		The resource of Menhaden in the bay has been overharvested for decades to the detriment of the entire region!!!
Christian Melendez	Maryland			There are multiple stresses on these fish. So taking action on one of the factors that we can actually control is worthwhile.
Dr. Michael Lewis	Maryland	Concerned stakeholder		There is ample evidence that (1) Menhaden are cornerstone prey species in the Bay; (2) there are population concerns with predator species that rely upon menhaden; (3) reduction in fishery pressure - up to outright bans - have been shown to work AGAIN AND AGAIN AND AGAIN in restoring fisheries. If we think of a fishery as something that we want to last for generations, we must control our harvest. If we maximize harvest and profits today, we will destroy the fishery as a generational asset. And if we want a vibrant and healthy Chesapeake Bay, we need a vibrant and healthy menhaden population.
Jill Fredrick	Maryland	Concerned stakeholder		There is clearly an over harvesting problem currently AND a need to drastically reduce the harvest to allow the ecosystem to recover
Brady Richardson	Maryland	Private recreational angler		There needs to be regulation imposed on this limited resource. The regulations support other jobs and other industries outside of those, by a specific group.
Richard Perrin	Maryland	Concerned stakeholder		These are complex issues affecting our environment. Overfishing of menhaden has certainly affected other species in the Chesapeake Bay environs and likely outside. There has been a reduction in osprey, eagles, crabs, rockfish, etc., and legislative efforts should be focused on both short term as well as long term initiatives.
Mark Gould	Maryland	Private recreational angler		These recommendations support: A 50% initial reduction in the Chesapeake Bay Cap A Bay Cap linked to the coastwide quota Less concentrated harvest during critical spring and summer periods Accountability for seasonal quota overages A required review of the Bay Cap every three years

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael vaughan	Maryland	For-hire vessel owner/operator/crew		These recommendations support: ◇ A 50% initial reduction in the Chesapeake Bay Cap ◇ A Bay Cap linked to the coastwide quota ◇ Less concentrated harvest during critical spring and summer periods ◇ Accountability for seasonal quota overages ◇ A required review of the Bay Cap every three years
Bob Flynn	Maryland	For-hire vessel owner/operator/crew		They should stop the harvest in Bay waters all together or how about they are able to catch one fish a day per person between 19 and 24 inches. Because the mass harvesting has led to these regulations for my buisness.
Robin Zimmerman	Maryland	Concerned stakeholder		This is an issue that must be approached conservatively. Applying high limits can be reversed, but irreparable harm will result if limits aren't applied immediately.
Michael Cavey	Maryland	Private recreational angler		This is extremely important for the ongoing health of the bay and all its habitat
James	Maryland	Private recreational angler		This survey is terrible - you need to be a statistics major to understand it. Also, stop letting foreigners come rape a pillage or local resources...Haven't we learned by now?
Garland P. Lowery	Maryland	Private recreational angler		This trend has long needed correction. Let’s make the responsible changes.
Kyle Decker	Maryland	Other (please specify)	Maryland resident concerned about ospreys	To protect and bolster the osprey population you must approve conservation-minded reforms that better protect menhaden and support a healthy Chesapeake Bay ecosystem.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Pepin	Maryland	Private recreational angler		To the Atlantic Menhaden Management Board: I am writing to urge the Commission to end menhaden reduction fishing in Chesapeake Bay. Virginia is the only Atlantic coast state that still allows reduction fishing in its waters. The Bay is a critical nursery area for menhaden and should not be the exception. I recognize that a full ban is outside the range of options in this addendum, I encourage the Commission to adopt the most stringent options available at this time. I am a lifelong recreational angler and boat owner. Every season I spend money at local marinas, tackle shops, and gas stations, and I pay boat registration and fishing license fees to be on the water. I accept that conservation requires sacrifice. Anglers like me now live with a one-fish-per-day limit on striped bass. But recreational fishermen have carried much of the burden of rebuilding striped bass, while the reduction fishery continues to remove the forage those fish depend on, in the very waters where they feed. Conservation in the Bay will not work if it is asked only of the people with a rod and reel. The reduction fishery must share in it. The draft addendum itself makes the case for strong action. Pound net harvests, the Choptank River survey, and striped bass reproduction numbers are all down. Because the TAC was cut in 2026 while the Bay Cap stayed the same, a larger share of the reduction harvest can now come from the Bay than at any time since 2017. That is the opposite of precaution. The Commission has managed this fishery under uncertainty since 2006 by using precaution. The evidence of declining menhaden availability in the Bay is now strong enough to justify the strongest precaution available. Thank you for considering my comments.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Douglas Harbold	Maryland	Other (please specify)	Maryland Master Naturalist and local resident	support for Option B4 in Draft Addendum II, which proposes a 50% reduction in the Chesapeake Bay industrial menhaden reduction fishery cap, lowering it from 51,000 metric tons to 25,500 metric tons. I also strongly advocate for the implementation of strict seasonal quota periods to prevent concentrated industrial harvesting. As a local resident living on Mill Creek in Lusby, Maryland, and a certified Maryland Master Naturalist, I am deeply connected to the health of the Chesapeake Bay ecosystem. Through my active volunteer work with local land trusts, I dedicate my time to conserving our watershed. Because I live on the water, I am uniquely positioned to observe the direct health of our local wildlife populations, and what I am seeing is deeply alarming. The Chesapeake Bay is currently facing a severe ecological crisis, driven heavily by the localized depletion of Atlantic menhaden. Over the past two years alone, I have personally witnessed a sharp, devastating decline in the number of nesting osprey pairs along Mill Creek and the surrounding waters. Active nests that once successfully fledged young are now empty, failing, or abandoned entirely. This widespread nest failure is a direct result of food insecurity. As the ecological foundation of the Chesapeake Bay, menhaden serve as a critical forage fish that sustains the entire marine food web. Ospreys rely heavily on this nutrient-rich resource to successfully feed and fledge their young. However, the current concentrated industrial reduction fishing practices are starving them out. Allowing an industrial fleet to extract over 100 million pounds of fish during a narrow summer window causes severe, localized depletion at the exact moment nesting ospreys and stressed striped bass need this forage fish most. This intense summer harvest breaks the local food chain, depriving predatory wildlife of survival essentials while simultaneously undercutting the livelihoods of local watermen, recreational anglers, and coastal tourism economies who depend on a balanced ecosystem To protect the long-term survival of the Bay's ospreys, managers must implement strict quota periods that distribute any permitted harvest evenly across the year rather than allowing an intense summer extraction. Thank you for your time, leadership, and consideration of these comments. I urge the Commission to vote in favor of Option B4 to protect our iconic osprey populations and ensure a resilient future for the Chesapeake Bay. Sincerely, Douglas

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Dianne O'Leary	Maryland	Concerned stakeholder		To those of us who are familiar with the portion of the Chesapeake Bay in Calvert County, Maryland, the evidence is clear: 1. The charter fishing boat industry has tanked. 2. For several years, ospreys have struggled to fledge chicks, signalling that the ecosystem of the Bay is in danger. 3. The rockfish (striped bass) population has dropped precipitously because they depend on menhaden. Rockfish was an important food source for those of us who live here and a source of income for professional fishermen. 3. The attraction of the area for tourism has dropped. It is very sad to contemplate any kind of job losses. But when you consider the losses in employment across the Bay due to the loss of menhaden in the Bay, it is clear that more than 176 jobs have been lost in the fishing and tourism industries, which is more than the losses would be due to cuts in the reduction fishery. The livelihood of people in the tourism industry, the beauty of the Bay, and the health of its ecosystem must take priority over the insatiable demands of the reduction fishery industry. Small business owners in tourism and fishing should not be shut down by the reduction fishery industry. The evidence is clear and the situation is dire. Use the results of the study later, but don't wait for it.
Jane Andraka	Maryland	Concerned stakeholder		virginia overfishes the menhaden. they need to reduce their fishing to protect ospreys and other birds' food supply
Richard Clarke	Maryland	Private recreational angler		Virginia should immediately stop the fishing of Manhaden in the Chesapeake Bay. They should also change the law for harvesting Manhaden to outside of the 3 mile coastal limit similar to all of the Atlantic Coast states. Either the Virginia legislature or the federal government and or both should close the tax free loophole that the Omega Corporation is receiving for Overfishing

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Stephen L. Geckle	Maryland	Private recreational angler		We have witnessed a dramatic decline in the species that depend on Menhaden to reproduce and repopulate the Bay and Ocean. All in the name of a company that has NO interest in being told they must repespect the other 95% of the population that also pays for conservation and protection our finite resources in the Chesapeake Bay. I believe if they continue unfettered, my children and grandchildren will never know the benefits of one of the most valuable resources in the country. All in the name of fertilizer and fish meal and cat food.
Robert Rhodes	Maryland	Concerned stakeholder		WE must never lose sight of best case for the Osprey!!! Remember man's greed is usually the culprit that creates these scenarios!! Man is most often reluctant to do the RIGHT thing!
David Buck	Maryland	Private recreational angler		We must reduce overharvesting in the Chesapeake Bay by factory ships
Steve Chang	Maryland	Private recreational angler		We need to correctly manage our fisheries so that we do not destroy the ecosystem and cause unknown ripple effects and long term industry and food resource viability.
John M SternJR	Maryland	Private recreational angler		We need to protect our most valuable natural resource, the bay
Edward L Mayne	Maryland	Private recreational angler		We need to reduce the harvest as much as possibly. Foriegn countries should not be allowed to take our resourses.
Dan Hueter	Maryland	Private recreational angler		We need to remember that this fish is essential to the entire ecosystem and without it everything suffers including people and many businesses that are in the industry as a whole.
TIMOTHY DONNELLY	Maryland	Private recreational angler		What ever is decided to be done should be the same for The Whole East Coast

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Elie	Maryland	Private recreational angler		Whatever we can do to shift harvest focus to more sustainable/less harmful sources of protein. Bug farming?
James Schuster	Maryland	Private recreational angler		Yes these fish are very important to our marine ecosystem throughout the Chesapeake Bay this fishery should be shut down there's no place for it in today's society where they take our fish and grind them up
Jake Stern	Maryland	Concerned stakeholder		You must take action to reduce the Menhaden take from the Bay. You saw what happened with overfishing in the cod fisheries of the North Atlantic- that is the path we are on and without careful management we will repeat that shameful history. That fishery collapse caused significantly more economic damage than management of the catch over time would have.
Noah Shumway	Maryland	Other (please specify)		Concerned about the health of our waterways
Valerie Swan	Maryland	Other (please specify)		Bird watcher concerned for the decline of Ospreys

Bobbie Wells	Maryland	Other (please specify)		I live on the Maryland Eastern and am concerned
Raymond Simmons	Maryland	Other (please specify)		wildlife rehabilitator directly seeing effects on Osprey
Helen D OConnor	Mass and Florida	Concerned stakeholder		Do the right thing act now to ensure the health of our birds, coast and people.
Kevin Blinkoff	Massachusetts	Other (please specify)	Private Recreational Angler, Work in Rec Fishing Industry	I also support a 40% reduction in the coastwide Total Allowable Catch (TAC) for the 2027 and 2028 fishing years without any delay or phase-in periods.
Nathan Medeiros	Massachusetts	Private recreational angler		I dont know jack about all the numbers, I fish constantly on cape cod, theres no peanut bunker this fall and barely any last year, the spring had no adult bunker as well!
Jill Silvia	Massachusetts	Other (please specify)	Massachusetts resident	:) let's keep it sustainable
Edward Baldwin	Massachusetts	Private recreational angler		American scallopers aren't allowed in Canadian waters. Why is a Canadian owned company allowed to overfish ours?
Jacob Freeman	Massachusetts	Private recreational angler		As a recreational angler in Massachusetts, fishing by boat 90% of the time, I was shocked at the distinct lack of menhaden showing up in our waters this year. The biomass has been steadily decreasing, and I think it is clear that the current level of commercial fishing for these critical baitfish is not sustainable. There should be significant reductions in harvest until the population recovers.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jimmy Durney	Massachusetts	Private recreational angler		As a recreational angler, I support the highest possible conservation measures for Atlantic menhaden. Even though I am a catch and release angler, I understand the importance of the fishery. Lobstermen, tuna fishermen, etc., up here in New England need them for bait. However, in my opinion, something in particular has to be done about Omega Protein and other companies harvesting pogies (menhaden). I believe these fish are too important to be turned into fish oil, animal feed and fertilizer. The Menhaden population is so important to not only the striped bass fishery which is what originally got me involved, but to many other fisheries, the health of the Chesapeake, bird populations, etc. Menhaden are the foundation of the food chain for so many game fish and commercial fish. Without pogies, we have no striped bass, bluefish, red fish, tuna, sharks, etc. Without pogies, whales and other marine mammals populations would be impacted. Eagles and Ospreys would also starve without pogies. I have spent many hours on the water this year and although I know pogies have been in the area to some level, I haven't seen them. Anecdotal, yes, but still not a good sign to not run into them all season. I want to save the fishery not only for me, but for my children and for generations to come.
Thomas Connors	Massachusetts	Private recreational angler		As a recreational fisher, I have observed first hand the decline in menhaden and the devastating impact that has had on birds such as osprey and fish such as tipped bass that prey on menhaden. Given the significant impact of a thriving menhaden population on the well being of many species of wildlife, it is in public interest to lower for the Commission to lower the menhaden cap to 50% of the current 51,000 metric ton fishing limit, to break the fish season into three quota periods, with a review of the cap every three years.
Joe Pereira	Massachusetts	Private recreational angler		Before it’s too late. We have to get ahead of this. We can not continue to be a death machine with every natural resource we touch.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael P. Dyer	Massachusetts	Private recreational angler		Boat sizes and hours should be restricted to individuals and families who have demonstrated responsible harvest techniques for more than two generations of people. Large-scale commercial harvesting of menhaden should be forbidden. Small-scale "subsistence" menhaden fishing is good for people and families.
John Yemma	Massachusetts	Private recreational angler		From my observation, compared to just a few of years ago, there are far less menhaden of all age classes in the areas I frequently fish, visit, or generally recreate in around New England. Please protect this important natural resource from the impacts of the narrow interests of the industrial reduction fleet. I also want to make it a point to join in support of public comments at meetings that believe more conservative, resource-friendly options should be available, and I would choose them if they were options in this survey. Thank you for the opportunity to comment and I appreciate your consideration for this important natural resource.
Steven Rogers	Massachusetts	Private recreational angler		Have some balls for once in your lives and do the right thing!
Tim Jones	Massachusetts	Private recreational angler		Honestly I'd like to see menhaden be left alone and not fished for at all by commercial netters. It takes away a VITAL food source for all inshore gamefish. Hence why the brown sharks are attacking them. Bc of a lack of menhaden
dawn	Massachusetts	Other (please specify)	concerned citizen	Humans need to decrease the amount of food resources that natural predators need to survive. We can make our own food sources, wild animals, like Osprey, have no choice. They can only feed their young what they can find. We have to cut back our "harvest".
Thomas	Massachusetts	Private recreational angler		I am a 16 year old high school student who has been fishing all my life. I remember growing up and remembering seeing bunker everywhere and loved watching these vast schools of fish getting blown up on by schools of stripers. In the past few years I have not seen a single pod of bunker. I love the ocean and the fishers that come with the beautiful water we have. I am asking that you put a 50% cut on the fishery of bunker which science says we need. Please listen to the fisherman and Science I want to have the ability to go out and fish a healthy ecosystem throughout my life.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James Reardon	Massachusetts	Private recreational angler		I care about the health of my fishery (Massachusetts - Buzzards Bay and Vineyard Sound). I also care a lot about the health of our Osprey and sea bird population. Please do something to help!
Justin Hansen	Massachusetts	Private recreational angler		I love fishing and care deeply about our ocean species. The menhaden population is vital to many different species and we need to make sure it is thriving. Thank you.
Kyle Jankowski	Massachusetts	Private recreational angler		I strongly support more restrictive commercial menhaden harvest regulations, particularly within the Chesapeake Bay. Menhaden are a critical forage species for striped bass and numerous other predators, and their ecological importance should be prioritized when establishing harvest limits. I believe the Board should consider meaningful reductions to the Chesapeake Bay harvest cap, stronger seasonal restrictions, and greater accountability for quota overages. Simply redistributing unused quota between fishing periods does little to address the overall amount of menhaden being removed from the ecosystem. Striped bass populations are already facing significant challenges, and protecting their primary forage species should be an important part of rebuilding efforts. I encourage the Board to prioritize ecosystem-based fisheries management, consider the needs of predator species, and ensure that commercial harvest levels are sustainable for the entire marine ecosystem, not just the menhaden fishery. Healthy menhaden populations support healthy striped bass populations. We need to manage this resource with the entire ecosystem in mind.
Toshia McCabe	Massachusetts	Concerned stakeholder		I support stronger protections for menhaden in Chesapeake Bay to protect nesting Ospreys, which this draft addendum does not mention. Chesapeake Bay supports one of the largest breeding osprey populations in the world, and menhaden are a key food that adults bring to their chicks.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
colin mansfield	Massachusetts	Private recreational angler		I support the most precautionary management options in Draft Addendum II. As a recreational striped bass angler and conservation-minded surfcaster, I believe Atlantic menhaden should be managed for abundance and their role as forage, rather than simply maximizing harvest up to a calculated sustainable yield. I support reducing the Chesapeake Bay reduction fishery cap by 50% to 25,500 metric tons, or using the 13.6% of coastwide TAC approach that produces the same cap at current TAC levels. I also support the quota-period option that limits early-season harvest and allocates 50% of the quota to the final period (B2), requiring overages to be paid back, and establishing a three-year review of the Bay Cap. The draft acknowledges that menhaden abundance and distribution in the Chesapeake Bay are not fully characterized and that recent observations include concerning declines in some fishery-independent and recreationally relevant indicators. Given that uncertainty and menhaden's importance as forage for predators, I favor precautionary management that leaves more menhaden in the ecosystem rather than managing toward the maximum amount that can be harvested.
Ryan Cavanaugh	Massachusetts	Private recreational angler		i vehemently do no support tying the coastwide tac to the bay cap
Erik Gura	Massachusetts	Private recreational angler		I would like to see the entire just to speak big men Hayden Fishery completely closed down to large scale commercial harvesting.
Henry Streeter	Massachusetts	Private recreational angler		I'm a recreational fisherman hoping to keep more menhaden in the ocean to feed the fish we target responsibly. Marine conservation is important to me and I'm concerned with all types of overfishing, not only menhaden.
Christian Finn	Massachusetts	Private recreational angler		I've seen the decline in the water, we need to take measures to reduce the harvest

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ronald Scharlack	Massachusetts	Private recreational angler		In 2025 the economic contribution of Atlantic recreational fishing with menhaden to the GDP was $833 million, but beyond the GDP is the health of the Atlantic ecosystem including stripers (and other fish) and salt water Osprey (and other sea birds) all of which have been negatively affected by the collapse of the population of menhaden. I urge the Board to adopt the above options in Draft Addendum II and set the 2027–2029 TAC at a level with a 50% or less probability of exceeding the ERP fishing mortality target. These actions would move Chesapeake Bay menhaden management toward a more responsive and ecosystem-based approach that recognizes the interconnected importance of menhaden to the Bay, striped bass rebuilding, and the broader Atlantic ecosystem.
Sam Falkoff	Massachusetts	Concerned stakeholder		Menhaden are a critical part of the marine ecosystem, not just a commercial fish supply. They should be managed as such.
Steven Robichaud	Massachusetts	Private recreational angler		Menhaden are a forage fish that is fundamental to the overall health of the ocean and multiple levels of fish that are above them in the food chain.
Emily Cosenza	Massachusetts	Concerned stakeholder		Menhaden are a very important food resource critical to the osprey population. We as Americans worked very hard in the 1970's to save them due to DDT and now we MUST HELP them Once again. They are not able to solve this but we are!
Anthony DeiCicchi	Massachusetts	Private recreational angler		Menhaden are critical to ocean health, coastal business relying on healthy resources both inshore and offshore, and are simply worth more economically remaining an abundant forage fish in the ocean than a product to be over harvested.
Allison Argo	Massachusetts	Concerned stakeholder		Menhaden are fishes who serve as food for other animals ranging from birds to whales. Some of these species are showing population declines believed to be caused by a decrease in menhadens. This is deeply concerning.
Jim Smith	Massachusetts	Private recreational angler		Na

Noah Lamperti	Massachusetts	Private recreational angler		No
Robert Stanton	Massachusetts	Private recreational angler		No
Tara De Veau	Massachusetts	Other (please specify)	Citizen of the U.S.A	No harm should be inflicted on another living being.
Joan Angelosanto	Massachusetts	Concerned stakeholder		None
Duane A. Bailey	Massachusetts	Concerned stakeholder		Osprey in the US should not be sacrificed to support commercial needed ours, here or abroad.
M Jacobson	Massachusetts	Concerned stakeholder		Overfishing has devastated osprey populations in the bay. Commercial overfishing needs to be capped and further regulated
Julian	Massachusetts	Private recreational angler		Place moratorium on commercial menhaden netting until they rebound and striped bass rebound. Or place the strictest rules enforcing the limits of the catch.
James Howard	Massachusetts	Private recreational angler		Please - for the love of our oceans - do what is right.
Howard Davis Jr	Massachusetts	Private recreational angler		Please consider bringing down the total allowable catch of menhaden coastwide ASAP.
Gage Gordon	Massachusetts	Private recreational angler		Please correct the issues with over fishing of the most important bait fish on the East Coast so that our kids can continue to enjoy the outdoors as we do.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ken Blanchard	Massachusetts	Private recreational angler		Please move commercial netting menhaden out of the bay to 3 miles off shore
Jeffrey Cotto	Massachusetts	Private recreational angler		Please protect these fish it is so important to the health of the ecosystem and action needs to be sooner than later before it's to late
Jennifer Herndon	Massachusetts	Other (please specify)	Concerned citizen	Please take action to reduce menhaden fishing to protect the environment for future generations
Craig Caldwell	Massachusetts	Concerned stakeholder		Reduce the harvest to sustainable population year tound
Jakob Wikar	Massachusetts	Private recreational angler		Save the menhaden please
David	Massachusetts	Private recreational angler		Something needs to happen all the way up coast and down the coast they're in the decline and something needs to be done because here in Massachusetts we're seeing less and less every year and this year is no joke there wasn't that many around
Derek Norcross	Massachusetts	Private recreational angler		Stop the Canadian company from over harvesting inside the Chesapeake Bay
Captain Tom Delo0tto	Massachusetts	For-hire vessel owner/operator/crew		Stop the madness - pogy boats were pushed offshore in early 2000 and results were almost immediate - huge increase in game fish.
Tara Moberg	Massachusetts	Private recreational angler		Thank you for considering the scope of impacts of this decision across the coast, species and food chain as well as the broader bio economy dependent

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Eric J. Las	Massachusetts	Private recreational angler		Thanks for considering my feedback.
Craig Nelson	Massachusetts	Other (please specify)	Commercial tuna fisherman	The amount of menhaden that is being harvested in Virginia is absolutely disgusting and completely negligent on the governments part. U can't take that many baitfish out of the ecosystem and not expect it to have major negative impacts on everything else higher up in the food chain. The more menhaden that are left In the ocean the better off everything else will be. Menhaden are a major food source for whales tuna sharks stripers Osprey etc. It's time to act now before it's too late!
Robert Raucci	Massachusetts	Private recreational angler		The Chesapeake bay should not be used for commercial harvesting of Menhaden. The fishery should be offshore beyond 5 miles.
Matt	Massachusetts	Private recreational angler		The fishery is aggressively being depleted. Any and all action to reduce over fishing is a must. ASAP
Kevin	Massachusetts	Other (please specify)	Striped bass fisherman and birdwatcher	The overfishing of menhaden is apparent and impacting many other species across the Atlantic coast. These fish are crucial to sustaining the held of our coastal wildlife (ospreys) and fish. Drastic action is needed and needed now. Manage for abundance and do not cater to special interest groups profiting off of this resource. The correct decision is to increase their population at any cost. Commercial fisherman's priorities cannot continue to negatively impact our fisheries. This is just another species on a long list that is being harvested into decline. The time to do the right thing has already passed but fortunately there is another chance now.
Stephen Lombardo	Massachusetts	Private recreational angler		The population is dramatically down and something needs to change to improve
Finn Sullivan	Massachusetts	Private recreational angler		The well being of wildlife, ecology and the ecosystem itself need to be taken into consideration. Ocean birds and plenty of other creatures rely on fish levels for sustainability. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Damon Sacco	Massachusetts	For-hire vessel owner/operator/crew		There is a problem with menhaden stocks that shouldn't be overlooked. Fishermen are concerned for a reason.
Jerry Audet	Massachusetts	Other (please specify)	Industry/Media; not charter or retail	These regulations need to mean meaningful changes ON THE WATER- not just on paper. Reductions in the last few years have made no difference, because the quotas could not be filled anyways. This is why the 50% reduction is so important.
Jenne Marie Sindoni	Massachusetts	Other (please specify)	ADVOCATE FOR THE REST OF THE PLANET	think about the rest of the planet and stop being GLUTTONS.
Leslie Kalinowski	Massachusetts	Private recreational angler		We need stronger, science-based protections that support healthy fisheries and thriving ecosystems, including lower catch limits and immediate reductions in Chesapeake Bay limits.
Corey Goodwin	Massachusetts	Other (please specify)	Private recreational angler plus commercial striped bass and Bluefin Tuna	WE NEED THE POGIES. The pogies have been noticeably thinner in the last few years surrounding Cape Cod and the Islands. It's time we had some change in this barbaric fishery. Without Pogies, nothing feeds - they are crucial to gamefish all along the east coast. Less Pogies harvested will result in a completely different and significantly healthier east coast fishery.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Valquirio S. Mendonca	Massachusetts	Private recreational angler		Will someone please use some common sense logic to the fishery ecosystem. Need a college degree in language tp understand this survey in full. Please just use common sense and stop over harvesting the fish. Let the suply and demand do its magic. Less fish on the market equals higher prices. Reduce the quotas by at least 50% now so we can have a sustainable fishery for our kids and grand kids. Change the harvesting techniques so that the fish is harvested with minimal or no discard of unwanted or undersized species.... and so on....USE COMMON SENSE. it will benefit all the in the long run.
Gabe Gries	Massachusetts	Private recreational angler		You need to protect these fish that are the foundation of recreational fisheries and need to stop allowing them to be exploited
Margaret D. Lewis	Massachusetts	Other (please specify)		love to visit the coast and admire the wildlife, espcially ospreys.
susan bliven	Massachusetts	Other (please specify)		I am concerned about over fishing
Wendy Hayward	Massachusetts	Other (please specify)		birder concerned about declining osprey population
Sharon Rosenberg	Massachusetts	Other (please specify)		citizen concerned about the environment
Marilyn Conrad	Massachusetts	Other (please specify)		Concerned about all life and its quality.
Peter Starke	Massachusetts	Private recreational angler		

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ann Massoth	Massachusetts	Other (please specify)		I am here to fight for ospreys and other marine species.
Paul Moss	Minnesota	Concerned stakeholder		The Commission should consider the interests of all and not solely those who fish. I've selected these options for the least fishing but in actuality want no fishing, for the sake of the menhadens and for the reasons mentioned above.
William Ash	Missouri	Other (please specify)	Ecological advocate	The impacts are already visible. The Bay's ecosystem is stressed. Small-scale watermen who target menhaden for blue crab bait report catches declining by more than 70% in recent years. Meanwhile, osprey chicks are starving at unprecedented rates in areas where menhaden were traditionally the primary food source. Please see the bigger picture for both animals and humans!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Morneault	New Hampshire	Concerned stakeholder		Dear Commissioners, I urge you to adopt a 50% reduction in the Chesapeake Bay industrial menhaden harvest cap to help protect ospreys from food shortages and chick starvation. Menhaden are a critical food source for breeding ospreys. Their abundance, nutritional value, and availability during the nesting season help determine whether adults can successfully raise their young. When suitable prey becomes scarce, chicks can starve in their nests. The Center for Conservation Biology reports that 2026 was the worst osprey breeding season ever recorded in Chesapeake Bay. Its monitoring documented severe food stress and reproductive failure across areas where ospreys depend on menhaden. By contrast, birds in freshwater areas, where other fish dominate their diets, had substantially better breeding outcomes. These findings deserve an immediate management response. (ccbbirds.org) Researchers acknowledge that the precise contribution of commercial fishing to local menhaden shortages remains unresolved. But they also explain that coastwide stock assessments can obscure whether enough appropriately sized fish are available where and when nesting ospreys need them. A sustainable coastwide fish population does not necessarily mean an adequate local food supply for wildlife. (frontiersin.org) That uncertainty supports precautionary action. I ask you to reduce the industrial harvest cap, evaluate seasonal and geographic protections around important osprey feeding areas, and fund independent monitoring of adult menhaden abundance and osprey breeding success. Future harvest decisions should reflect whether these measures improve prey availability and chick survival. I recognize the importance of fishing livelihoods. Responsible management must also preserve the ecological role of the fish being harvested. Leaving more menhaden in the water is a practical precaution while research continues. Please act now to reduce the risk of further starvation and breeding failure. Protecting ospreys requires protecting the food supply on which they depend. Thank you for considering my comment. Michael Morneault Durham, New Hampshire

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jim Eiffe	New Hampshire	Private recreational angler		Save the bunker
Chloe caban	New Jersey	Concerned stakeholder		#saveourospreys

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
B. Snyder	New Jersey	Concerned stakeholder		(I submitted the following comment through the American Bird Conservancy website, using the same email address, but am not sure that comment went through.) Thank you for considering my comments and for your commitment to responsible menhaden management. I live in New Jersey, and would ideally like for industrial fishing of Menhaden to be completely paused for some length of time in every part of the Atlantic Coast, if not totally eliminated, until stocks have time to recover. But since a 50% reduction is what is on offer in your Draft Addendum, I choose that. It is 100% clear that something is disastrously wrong on the East Coast, when Osprey chicks are starving in their nests because their parents cannot find fish to feed them. Ospreys are the best fisherman of all birds, and have been doing this for tens of thousands of years. Yet ospreys have been declining on the coast for a number of years now, and it's only happening in saline waters; osprey nests in freshwater areas are doing fine and in fact thriving. If Menhaden are the most important fish in the sea, and companies like Omega are literally sucking them all out of the waters, then Omega et al. are stealing our own resources from us for the sake of their profits and heedless of the effect it has on our communities and our wildlife. It is unconscionable to allow this to go on; we already know it's disastrous for ospreys, which are very visible. We DON'T know what other species are being hurt. And we DON'T know what effect that will have on the ecosystem as a whole. Ospreys have been canaries in the coal mine before, during the DDT crisis - and it looks like this is happening again. We MUST do whatever it takes to restore the health of the ocean and menhaden, for the sake of all the creatures that share the planet with us, and for our own sake as well. Corporations clearly cannot be trusted to manage themselves, so we must manage them. I beg you to consider further reductions in menhaden fishing (if that's what you call this industrial thing that is decimating an entire fish species). Other fish depend on menhaden, too; it's long past time to work under sustainable limits. The time to act is now, before even worse things happen and the entire ecosystem is decimated.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert	New Jersey	Private recreational angler		50% reduction on commercial
Sue Smith	New Jersey	Other (please specify)	Concerned citizen	A moratorium on all menhaden catch for 2 years
Edward Fuzer DC	New Jersey	Private recreational angler		A moratorium on Bunker fishing should be imposed just like the Regulation in the Delaware River for blue back Herring. The Survey questions are missing the big picture and very limited in scope by design . We have seen the reports from Stockton State college about the devastation of the Osprey chicks. The Osprey chicks mortality are the canaries in the coal mine. If we continue to allow profit over conservation to continue the entire ecology will collapse. A complete moratorium is the option of choice. Dr. Fuzer
Mike Skirka	New Jersey	Private recreational angler		Action should be taken to drastically reduce reduction boat take of menhaden everywhere. Overquota should be penalized by deduction from subsequent periods. Two overquotas in the same year disqualifies from the next year.
Alan Swider	New Jersey	Private recreational angler		Allowing harvest underages in periods 1 and 2 to passed on to period 3 would have greater impact on the most critical striped bass migration weeks. Pushing into the following year would have the same impact. I support a 50% total reduction spread evenly thoughout the year. This fisherry needs to rebuild as quickly as possible.
RICHARD P MELTON	New Jersey	Private recreational angler		Although the quota is reduced in Cheseapeake bay may be reduced by 50% the remainder 50% should not be allowed to be harvested elseware.
Dan Shatrowsky	New Jersey	Private recreational angler		Any harvest should only be allowed after spawning is done.
John W Goshen	New Jersey	Private recreational angler		As a eastern shore virginia landowner who is in the process of relocating to the Chesapeake Bay area, health menhaden populations and a health bay is very important to me and my family.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ashlee Lloyd	New Jersey	Other (please specify)	Wildlife conservation advocate	As a wildlife lover and as an avian rescue/transporter, I'm urging the consideration to keep as many Atlantic Menhaden in the water to support multiple species relying heavily on their prey of fatty bunker. The evidence in NJ has shown sufficiently that one species in particular, Osprey, are struggling to produce viable fledglings as they are unable to locate their primary food source. Each year the data becomes more disturbing with fewer chicks surviving, some adults taking off for weeks at a time abandoning their nest obligations as they seek food, and some leaving their sites months prior to their usual migration patterns. This season has seen many emaciated chicks rescued and sadly I've personally witnessed their demise as a result of food stress. I thank anyone reading this for your consideration in making sure an abundant source of food stays in the water, especially at critical nesting times of the season.
Joe DiDario	New Jersey	Private recreational angler		As an angler in NJ, it is clear that our menhaden stocks are severely depleted from overfishing, and the lack of menhaden is having a clear impact on gamefish populations. We need action to be taken for the survival of our entire angling industry and community, as the health of our oceans depends on the health of menhaden stocks.
Renee	New Jersey	Private recreational angler		ASMFC commissioners and NJDEP need to support a 2027-2029 coastwide TAC projected to achieve the ERP F target. The ERP target is designed to rebuild striped bass — a core New Jersey fishery. NJ needs to vote for a quota that has a 60 or 75% chance of achieving this vital ERP target. End reduction fishing in the NJ/NY bight.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Joseph Albanese	New Jersey	Private recreational angler		Based on my personal observations - ospreys with very small or no fish in their talons, swooping down into the surf zone at my feet to grab a 14" fluke I released, seeing very little sign of peanuts and/or adult bunker inshore (or offshore) all year-long, etc. - I would support a moratorium of reduction fishing by Omega Protein in any state waters on the east coast or Chesapeake Bay. Unfortunately, this is not even an option being considered. Since catch quotas are set by weight in metric tons, the actual numbers of fish being harvested now are much greater. Simply put, juveniles weigh less than adults. Duh! So, a 50% reduction will amount to little. Another downside is immature fish don't get the chance to reproduce. Combined this means the stock is becoming non-sustainable. The time to act is now, before it's too late. Local fisheries that net bunker as bait for tackle shops and lobstermen represents only a small fraction of commercial harvest and should not be further restricted.
Donna Marino	New Jersey	Concerned stakeholder		Because Menhaden are fish who serve as food for other animals ranging from birds to whales, I urge you to limit the amount they can be fished. Some of these species they feed are showing population declines believed to be caused by a decrease in menhadens.
Tom Kowalak	New Jersey	Private recreational angler		Because these VA. boats have raped and pillaged the coast's bunker population over the years, there must be some punitive action. Make them suffer a drought in profits as we recreational guys have suffered a drought in sporting enjoyment, for multiple years since the 80's. Allow our grandkids enjoyment of striper fishery etc.....
Jeff Williams	New Jersey	Private recreational angler		Board should enact optimum limits to sustain the fishery and our wildlife populations
Kieran S Golden	New Jersey			Bunker are the base of the food chain and when depleted suddenly in an area it causes large imbalance in the food chain. We had plenty of Bunker here in nj off sandy hook, Bunker boats came and took so much in one shoot its been a different ocean ever since.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kathee Cousins	New Jersey	Other (please specify)	Someone who cares about Ospreys and their ability to feed their offspring.	Clearly there is an imbalance that needs to be addressed immediately!
John Rogalo	New Jersey	Private recreational angler		Coastwide impacts from overharvesting are already obvious. The problem will not be easily solved as there is big money attached to the use of the resource. I find it ironic that the recreational quotas for our fisheries are cut at the drop of a hat but, when it comes to the commercial harvest of Menhaden, there appears to be little or no consideration for meeting of long term standing biomass goals.
ryan lippmann	New Jersey	Private recreational angler		Commercial allowable catch limits for Atlantic menhaden should be reduced because menhaden serve as a critical foundation for the entire marine ecosystem. They are a primary food source for economically vital sportfish (like striped bass, bluefish, and weakfish), marine mammals, and seabirds (such as ospreys and eagles). The dolphin and whales and seals and all marine life need the abundance to survive and we can tell by spending a lot of time on the water that menhaden numbers are drastically down. Leaving more menhaden in the water directly supports the recovery and stabilization of these predator populations, which are currently facing severe pressures.
martin v smith	New Jersey	Private recreational angler		Common sense tells us a year long moratorium is the first action to initiate.
john t. conyack	New Jersey	Private recreational angler		Completely stop commercial reduction for three years and pass laws to remove Canada or any non American harvesting

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Lee Farnham	New Jersey	Other (please specify)	Dedicated environmentalist with 40 years experience supporting environmental concerns.	Consider revisiting the situation more frequently, either annually, or every other year.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Linda Ann Higgins	New Jersey	Other (please specify)	Concerned Ocean County resident and former moderator at Barnegat Light Live Osprey Nest Cam.	UNIFIED PUBLIC COMMENT PACKAGE Atlantic Menhaden Draft Addendum II Submitted October 9, 2026 ——————————————————————————— To the Atlantic Menhaden Management Board, Thank you for the opportunity to comment on Draft Addendum II. My connection to coastal ecosystems began in childhood. I saw my first osprey at age five while fishing at Forge Pond in Brick, New Jersey, and I remember wondering why they suddenly disappeared during the same years our neighborhood in Birchwood Park was being sprayed for mosquitoes. It wasn't until my first Earth Science class that I learned about DDT and understood what had happened to the ospreys I grew up watching. I have been a shore girl with sand in my shoes ever since, and that lifelong connection to coastal wildlife is why the current concerns about forage availability resonate so strongly with me. The information presented in Draft Addendum II is deeply concerning. The document states: "Recent observations… suggest that availability of menhaden in Chesapeake Bay may be changing." This is not theoretical. In 2023 and 2024, we saw clear, measurable impacts: • Maryland pound net harvest declined 60% in 2024. • CPUE dropped sharply across Maryland, PRFC, and Virginia. • Independent surveys (Choptank River) show menhaden abundance collapsed in 2024 and remained low in 2025. • Predators such as striped bass, bluefish, weakfish, and osprey are already experiencing stress. These indicators point to a forage shortage with ecosystem wide consequences. ——————————————————————————— ★ Menhaden as Filter Feeders — Water Quality Matters ——————————————————————————— Atlantic menhaden also play a critical role in maintaining water quality. As filter feeders, they help remove excess nutrients and particulate matter from coastal waters, improving clarity and reducing the risk of harmful algal blooms. Protecting menhaden abundance is not only about supporting predators; it is also about preserving the water quality that sustains the broader Chesapeake and coastal environments. ——————————————————————————— ★ Documented Predator Impacts: Barnegat Light Osprey Nest (2023)

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Paul Kaster	New Jersey	Private recreational angler		Data based management of Menhaden and the gamefish, seabirds, and whales that depend on them as a primary food source is essential. Gathering accurate data on how much protein these predator species need to survive and reproduce effectively is needed urgently. It is part of the ASMFC's responsibility to gather this kind of data. Menhaden reduction fishing primarily benefits a tiny number of corporations and employs relatively few people. It is hard to place a dollar value on the northeast Atlantic ocean's ecosystem in terms of what it means to fishing communities, recreational fishermen, crabbers, lobstermen and tourism-based businesses. But I'm sure it's in the billions of dollars. It is also part of our culture and as someone who has spent a lot of time on the water for his entire life, the damage commercial menhaden reduction fishing is doing to the ecosystem is tragically obvious.
Dennis DeMizio	New Jersey	Private recreational angler		Due to severity of the situation, The Chesapeake Bay Cap should be revisited 1-1/2-to-2 years after implementation of this draft addendum. Police Omega in NJ waters!
Stewart	New Jersey	Private recreational angler		Fishing has been terrible without the forage fish for them.
Elizabeth Thompson	New Jersey	Concerned stakeholder		From your own website: "Our History: ... the Atlantic coast states came together to form the Commission... acknowledged the necessity of the states joining forces to manage their shared migratory fishery resources... and promoting and protecting Atlantic coastal fishery resources." The Menhaden schools belong to all the states, wildlife predators, fishermen, citizens, etc. No one business monopoly and/or one state should be permitted to consume/take 80% of the entire coast population of menhaden. Please review your MISSION and "promote cooperative management of fisheries" for all. Thank you very much.
Steve Katrensky	New Jersey	Other (please specify)	Concerned citizen	Give the fish a chance, dude.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Larissa Smith	New Jersey	Other (please specify)	Wildlife Biologist, work with NJ osprey population	Hello, I am a wildlife biologist that has worked with ospreys in southern NJ for over 25 years. I have seen the results along the Atlantic Coast NJ osprey population and the past few nesting seasons has been very depressing, as the number of chicks is at the lowest ever. As a citizen, I find it very frustrating that certain people have access to the fishery "resource" when it's everyone's resource. I want my resource of menhaden to not be caught and to be used by wildlife.
Melanie Schroer	New Jersey	Other (please specify)	Biologist, osprey researcher	I advocate for maximally precautionary management options for menhaden. Our predators dependent on menhaden indicate a scarcity of this most valuable prey species. In my network, I have heard from fishermen, bait shop owners, and the owner of a whale-watching that they've seen hardly any of these fish schools this summer. Please don't wait until the fishery has collapsed to make conservative management decisions. There is too much at stake here. Let us significantly reduce the pressure of harvest, allowing the species to recover and scientists to further investigate the multifaceted explanations for their decline.
Joseph White	New Jersey	Private recreational angler		I also support that the coastal Total Allowable Catch be significantly lowered.
Esther James	New Jersey	Concerned stakeholder		I am a concerned citizen who would like the menheden harvest RESTRICTED as much as possible to protect the osprey population.
Brielle Jeffries	New Jersey	Concerned stakeholder		I am a concerned local resident. We have watched as the Osprey population has dwindled and watched as the fledglings starve to death. Although there is not sufficient evidence to support that reducing the cap would help, I think we need to do what we can do to make sure our wildlife survives around us. If the Ospreys disappear, we will have much bigger issues that fall like dominos. Please consider reducing the cap by 50%.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Shanahan	New Jersey	Concerned stakeholder		I am a longtime bird surveyor and field naturalist in southern New Jersey, where I have observed troubling problems with osprey nesting success and apparent food availability. My observations have been most consistent at Stone Harbor Point, where I observe foraging ospreys weekly. I have also witnessed similar concerns in the Cape May area, though less frequently, and along Delaware Bay, primarily at PSEG's public-access Estuary Enhancement Sites. I have observed young ospreys apparently receiving inadequate food, raising concerns about adults' ability to find sufficient prey. Friends who regularly fish these waters have also reported a troubling scarcity of menhaden. These are personal observations and anecdotal reports, not proof of causation. However, they are especially concerning in light of recent research documenting serious reproductive problems among Chesapeake Bay ospreys. One important example is Watts et al. (2026), Widespread reproductive deficits in Chesapeake Bay ospreys, published in Frontiers in Marine Science (https://doi.org/10.3389/fmars.2026.1685158). Menhaden are a critical part of coastal food webs, supporting ospreys, other fish-eating birds, predatory fish, and marine wildlife. Their ecological importance extends far beyond their commercial value. I recognize that this addendum focuses on Chesapeake Bay, but concerns about forage-fish availability extend throughout the Mid-Atlantic. I urge the Commission to take a precautionary, science-based approach that recognizes the importance of menhaden to the predators that depend on them, while continuing to investigate the relationships among fishing pressure, prey availability, and reproductive success. Such an approach also supports the long-term sustainability of the menhaden fishery and the livelihoods that depend on it. Healthy fisheries and healthy wildlife populations are not mutually exclusive goals. For those of us who spend considerable time observing coastal wildlife, these concerns are not abstract. We are witnessing the struggles of nesting birds firsthand. Thank you very much for considering my comments.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Andrew Genovese	New Jersey	Other (please specify)	External researcher	I am asking the Board to manage menhaden for abundance. Striped bass, bluefish, osprey, whales, anglers, bait fishermen and coastal businesses depend on them. For Draft Addendum II, please reduce the Chesapeake Bay reduction-fishery cap by 50% to 25,500 metric tons and distribute that harvest evenly through the season. When the Board sets the 2027–2029 coastwide TAC in November, please use the updated Technical Committee projections and the newest available science to make a meaningful coastwide reduction at least 30% from the current TAC, and more if needed to reach the ecological target.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Frank Sanfilippo	New Jersey	Private recreational angler		I am writing as a New Jersey angler/fisherman to express concern about the impact that concentrated reduction fishery harvest of menhaden (bunker) in the Chesapeake Bay is having on menhaden availability and, in turn, on fishing here in New Jersey. Menhaden are the foundation of the bait fishery and forage base that New Jersey's recreational and commercial fisheries depend on — for striped bass, bluefish, tuna, weakfish, and other key species. When large volumes of bunker are pulled out of the Chesapeake Bay concentrated in the spring and summer months, it reduces the number of menhaden migrating north and available along the New Jersey coast during our peak season. I have personally seen [describe what you've observed — thinner bunker schools, fewer bait pods, harder time sourcing live/fresh bunker, slower striper/bluefish fishing, etc.]. This isn't just an ecological issue — it's an economic one. Menhaden-dependent recreational fishing generates hundreds of millions of dollars in angler spending and supports thousands of jobs coastwide, much of it flowing through tackle shops, marinas, charter boats, and bait dealers in New Jersey. When bunker becomes scarce or hard to find, that spending — and the businesses that depend on it — takes a direct hit. For these reasons, I support: Reducing the Chesapeake Bay Reduction Fishery Cap, to help rebuild bunker abundance along the coast. Tying the Bay Cap to the coastwide TAC so it scales down automatically if the coastwide quota is reduced, rather than staying static. Establishing quota periods to spread reduction fishery landings across the season instead of concentrating them early and mid-season, when NJ's bait and recreational fisheries need bunker the most. New Jersey's fishing economy relies on a healthy, well-distributed menhaden population. I urge the Board to adopt the more conservative options in this addendum to protect that resource. Thank you for considering my comments. Frank Sanfilippo Sewaren, New Jersey]
Jon Brunetti	New Jersey	Private recreational angler		I believe that the total allowable catch for menhaden should be significantly lower. I myself have seen a substantial decrease in the number of menhaden seen out in the ocean and bays.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Lizmary Nadal	New Jersey	Other (please specify)	None	I care about the environmental impact this has on the wildlife in NJ. I hope this is a step in the right direction to support our local osprey population and conservation efforts.
Anita Cronk	New Jersey	Other (please specify)	Bird watcher	I don’t have the expertise to recommend limits but I do know ospreys need to feed their young.
John Wachter	New Jersey	Private recreational angler		I don't understand all these options so I have left them blank. I live 1 block from the beach i9n Nj and fish almost everyday. The numbers of menhaden has continued to drop for the last 10 years and the impact is very noticable. The sophisticated methods used are causing serious declines with the use of planes and electronic equipment. The fish don't even reach spawning age. We do not see as many whales, porpoises, ospreys and all sealife because of the decline in food for them. If the food source is no longer available the entire food chain is in jeopardy. we need regulations that adjust the same as with other fish. these regulations should be implemented for the entire east coast!!
Hillary Leonard	New Jersey	Other (please specify)	Birdwatcher	I have been a birdwatcher for 3 decades. I am disgusted by the mass starvation of coastal Osprey young in my home state and in other states. I tried to select the most conservative option in your survey. A multi-year moratorium is needed to help the species recover is what we really need.
Stephen Foell	New Jersey	Concerned stakeholder		I have seen the predators of menhaden starving. I have heard from fishermen that menhaden are nowhere this year. I am concerned for the ecosystem. Please enact the most conservative measures to protect this species for the good of the whole foodweb and coastal economy!
Noelle Quanci	New Jersey	Concerned stakeholder		I hope we can, once again, do the right thing to preserve the biodiversity of our coast for our children...
daniel wiest	New Jersey	Private recreational angler		i just want to see the fishing to be good again try and get our waters back to steady fishing

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Redpath	New Jersey	Concerned stakeholder		I noticed an alarming drop in successful osprey fledging on Barnegat Bay starting in 2025 and reached out to a number of environmental groups. We have to be careful that we don't just focus on osprey, but rather embrace that they are a rather large "canary in the coal mine" indicating an upheaval in our coastal ecoSYSTEM that needs immediate attention.
Katy simon	New Jersey	Concerned stakeholder		I strongly support taking a precautionary approach and pursuing the largest percentage reduction in quotation. This is a pillar species that sustains other significant fisheries, as well as iconic birds of prey like the osprey.
Michael B Day	New Jersey	Other (please specify)	Private crab fisherman and supporter of Osprey conservation efforts	I strongly support these changes and urge the Commission's adoption of them to help sustain multiple fisheries and marine related industries and to help preserve critical food stocks for Ospreys which have faced serious food shortages and reduced breeding success in the area where I live and fish.
Linda T	New Jersey	Other (please specify)	Concerned citizens	I support any option that would cut the bay cap by 50% and tie it into the TAC, establishing strict seasonal blocks to spread out Fish, mortality and to protect juvenile nurseries during peak periods. I support protecting predators throughout the marine ecosystems of both the bays and the ocean. Osprey are not successfully reproducing, which is an indicator of the health of the entire Marine ecosystem. Osprey may just be the first species to fall - if something is not done immediately many more species of birds, fish, and marine mammals will be affected. All of these depend on the food web for their survival. Thank you.
Robert Harris	New Jersey	Concerned stakeholder		I think these options will allow us to best support the Chesapeake Bay and ensure the health of our birds, people, and coasts. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Karen Williams	New Jersey	Other (please specify)	biologist with a deep concern for the ecosystem	I urge the ASMFC to take strong action to reduce the Atlantic Coast catch of menhaden. While there are some data that show that the population of menhaden is healthy there are also a lot of observations showing that species that depend on menhaden are showing reproductive declines and /or changes in behavior. For example, osprey chick production has precipitously declined in NJ. Additionally, bottlenose dolphin have been observed in the back bays of Cape May County and up the Maurice River as far as Bivalve, behaviors that have only been observed in the last 2 years. This behavior suggests that there is little food in the areas where they usually occur. Strong actions to conserve the population of Atlantic Menhaden BEFORE a total crash will have many benefits, including: - a healthy, diverse ecosystem - economic benefits to local economies due to a strong ecotourism industry - a SUSTAINABLE menhaden fishery Thank you for your consideration.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Trish Daley	New Jersey	Private recreational angler		I was able to attend the 9/29/26 virtual meeting; however, I was unable to activate my microphone to participate in the comment period of the meeting. I submitted brief blurbs via the "Questions Chat Box" that evening. (I will not be redundant and repeat them here; thank you James Boyle and staff for recording my electronically submitted comments/ideas that evening.) I was also able to attend the slide show portion of the 10/1/26 virtual meeting; I am a high school Special Education teacher and that evening was back to school night for my school. I had to log off promptly at 6:25 PM EDT. Some of my students are currently learning about apex predators. One topic we have discussed is menhaden and how there are a vital food source for many apex predators. My students and I would like to see very strict limits for the next three years, allowing the fishery a reprieve from overfishing. A topic we have not had time to discuss is that many families depend on the fishery for their livelihood; however, it has been on my heart and mind. An out of the box idea has "bubbled up" and perhaps it could be considered in three years time (provided Option B in Q 11 is adopted). Out of Box Idea: Mega/large fishing corporations have an extremely restrictive limit as to what they can catch with their own vessels. However, they can choose to purchase catches from smaller family owned watermen companies; by doing so, their "harvest" limit is increased - because they are purchasing from watermen. The vision is to intentionally create a sustainble "middleman" culture with the fishery. I realize that this is a very crude and rudimentary idea - I have no idea if it is even feasible/worth while. It just feels like it could be a way to support: the menhaden, the apex predators, the waterman families, and large corporations, like Omega...while keeping in mind overall limits are necessary to protect recreational anglers and conservationists concerns. Again, my students and I would like to see very strict limits for the next three years, allowing the fishery a much needed reprieve from overfishing. Thank you so much for your time and efforts in gathering public opinion and keeping us informed.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Karen Arnheiter	New Jersey	Other (please specify)	Lover of wildlife.	I would like to see NJ ospreys thrive and increase. They need to recover from a bad breeding season due to the lack of Menhaden.
Robert mahnke	New Jersey	Private recreational angler		I would like to see the harvest of menhaden closed during the spring and fall striped bass migration.
Otto Munz	New Jersey	Private recreational angler		I would much prefer keeping the quotas to off shore waters .
Alec Fernandez	New Jersey	Private recreational angler		I'm a life long fisherman and have noticed a drastic change in our fishery the past few years. If we want to keep a healthy fishery it starts with keeping our bait healthy and sustainable. We need to see change ASAP it starts here!!
Victoria Percy	New Jersey	Concerned stakeholder		I'm in favor of the 50% reduction only due to it being the most conservative management plan being considered!
Darlene Kowalski	New Jersey	Private recreational angler		I'm very worried about the ospreys and the ecosystem in general. Please ban Canadian menhaden boats in the Chesapeake and elsewhere.
Anthony Sickinger	New Jersey	Private recreational angler		If no action is taken, the striped bass population will be gone, our grandchildren will never be able to fish for this amazing species!
Diana Cirillo	New Jersey	Other (please specify)	Concerned citizen	I'm not sure how big of a crisis is needed before a change is made, but we're there. Everyone can see it.
Bob McLynn	New Jersey	Private recreational angler		It is a crime that the menhaden population is being decimated this way. We need to protect them so the real predators have enough food and keep our waters thriving
Dana Eglinton	New Jersey	Private recreational angler		It is imperative that the harvest of menhaden be reduced as they are a critical component of the near shore fisheries and ecosystems.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James Learn	New Jersey	Private recreational angler		It is so obvious to all that the reduction of the Menhaden catch is necessary to sustain and possibly improve the fishery.
Douglas A Taylor	New Jersey	Private recreational angler		It is well known, though the Atlantic Menhaden is not considered to be a game fish, but is a very important species for both the health of the water system (being filter feeders that help to control includes zooplankton, several species of phytoplankton including Pfiesteria, as well as suspended organic plant detritus and algae blooms) and as a feed source for fish further up the food chain, stricter harvest limits must be established. Taking the NOAA reported metric tonnage over a 66 year history covering 1950 thru 2006 for the Atlantic Menhaden and breaking this information down into different categories, trends did develop. It was noted that as the years progressed the Gulf total tonnage was starting to mimic the Total Metric Tonnage Landings (this trend starts approximately in1966); The Atlantic catch was diminishing and starting to follow the trend and mirror the Chesapeake landings (this trend is most noticeable starting in1983). Today, the total catch is set at a much lower amount than what was the total catch of 2006 without a real gain in the estimated population. One other thing to consider that due to the high concentration of netting just east of the Chesapeake Bay Bridge, this boundary be redefined as of at least 5 miles east of the Chesapeake Bay Bridge.
Gabrielle Kertz	New Jersey	Concerned stakeholder		Leave more fish for the Ospreys and other wildlife that depend on them in the ecosystem
Elizabeth	New Jersey	Concerned stakeholder		Let us conserve this precious environ...
Grace Miller	New Jersey	Concerned stakeholder		Limit Menhaden harvest, the osprey need them!
George McNamara	New Jersey	Private recreational angler		Lower the coastal Total Allowable Catch to a level that ensures that striped bass can rebuild quickly.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Linda Haertel	New Jersey	Private recreational angler		Lower the coastal total allowableccatch
Christina Smith	New Jersey			NA
Cole Kennedy	New Jersey	For-hire vessel owner/operator/crew		No
Kevin Markow	New Jersey	Private recreational angler		No
Gerry Zagorski	New Jersey	Private recreational angler		Not sure why the reduction in Chesapeake Bay is even up for discussion. Its needs to get done since one foreign company is responsible and profits from what is a public resource. The absence of Bunker threatens the entire Striped Bass fishery that every state and many more fishermen rely on. The economic impact of recreational Striped bass is $7.8 billion annually and 104, 000 jobs coastwide, compared to $200 million and 500 jobs for Bunker reduction that is all in one small town in one state.
George Richard Horvath	New Jersey	Private recreational angler		Ospreys are dying and not reproducing and surf fishing is not good because of the lack of menhaden.
capt. brian williams	New Jersey	For-hire vessel owner/operator/crew		our coastline is dying we need the bunker to be protected now! i selected the options presented. but i believe all bunker netting should be ended now!
David Giordano	New Jersey	Private recreational angler		Our fisheries desperately need a revival. Let’s do our part and restore the east coast

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jennifer Douglas	New Jersey	Private recreational angler		Please also significantly lower the coastal total allowable catch.
Sam mancino	New Jersey	Private recreational angler		Please also significantly lower the coastal Total Allowable Catch
Matt Rummler	New Jersey	Private recreational angler		Please also significantly lower the coastal Total Allowable Catch
JOHN F ORLOWICZ	New Jersey	Private recreational angler		Please also significantly lower the coastal Total Allowable Catch.
Adam solleder	New Jersey	Private recreational angler		Please also significantly the total allowable catch
Ryan Catton	New Jersey	Private recreational angler		Please be respectful of future generations and the desire to have a continuing fishery for all anglers to Enjoy..
Louis DeMarco	New Jersey	Private recreational angler		Please consider expanding catch limits to include coastal waters along NY/NJ/DE/MD/VA and monitor the results of catch limits every 3 years.
Leah Korejko	New Jersey	Other (please specify)	Concerned citizen, non fisherman	Please consider revision so we don't loose such an important species to our coastline. It's glaringly obvious we need to take action to protect our Ospreys.
Cynthia Lamb	New Jersey	Concerned stakeholder		Please consider this measures for saving the health of our wildlife and the fishing industry, and the continuing to support the natural resources of our coast.
Emma Guest-Consales	New Jersey	Concerned stakeholder		Please do whatever you can to stop overfishing and to bring back menhaden to the bays.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jake Lemcoe	New Jersey	Private recreational angler		Please drastically reduce the amount of bunker commercially harvested as i personally have seen a huge reduction in then over the last few seasons. Striped bass as well as other marine life heavily rely on them to survive and keep reproduction strong. Also please try and limit the international boats commercially fishing for bunker in US waters.
TIMOTHY DOOLAN	New Jersey	Private recreational angler		Please help save the Menhaden population.
Michael A Bukosky	New Jersey	Private recreational angler		Please lower the allowable catch - I have been fishing for over 50 years and the bunker have disappeared. Please save our ocean
Arnold Ulrich	New Jersey	Private recreational angler		Please lower the coast wide Total Allowable Catch to a level that ensures that the striped bass can rebuild quickly and, that the coastal ecosystem has a sufficient abundance of bunker for all marine life to thrive.
Douglas Itjen	New Jersey	Private recreational angler		Please lower the coastal CAC
Bill Machotka	New Jersey	Private recreational angler		Please lower the coastal Total Allowable Catch. If you just lower Chessapeak then more will be taken off where I live. BOTH are important. Thank you
Colette Liberatore	New Jersey	Other (please specify)	Concerned Citizen	Please lower the coastwide catch limits to support the ecosystem and its wildlife, and reduce the Chesapeake Bay harvest cap as research continues. Thank you.
Mary Lauko	New Jersey	Concerned stakeholder		Please protect the ecosystem, the ospreys, and prevent overfishing.
Joseph	New Jersey	Private recreational angler		Please reduce the coastal TAC. The fact they need to use spotter planes to net the bunker should be be proof enough that the stocks are in trouble Many fish and most wildlife rely on bunker for food. Striped bass, Osprey et al. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Constance J Malach	New Jersey	Private recreational angler		Please Save the Osprey's food source !
Thomas	New Jersey	Private recreational angler		Please significantly lower the coastal Total Allowable Catch (TAC) to a level that ensures that striped bass can rebuild quickly and so that the coastal ecosystem has a abundance of bunker for all creatures to thrive
Randall E Vieser	New Jersey	Private recreational angler		Please significantly lower the coastal Total Allowable Catch (TAC) to a level that ensures that striped bass can rebuild quickly and so that the coastal ecosystem has a abundance of bunker for all creatures to thrive. Also basically please do the right thing to protect our marine ecosystems - Thanks
Louis Van Bergen	New Jersey	For-hire vessel owner/operator/crew		Please significantly lower the coastal Total Allowable Catch (TAC). Allow the bunker population to recover and the higher trophic levels of the food web will follow suit. This includes, but is not limited to, striped bass, bluefish and ospreys.
Kenneth Hollins	New Jersey	Private recreational angler		Please significantly lower the coastal Total Allowable Catch, thank you
Bruce M Caporale	New Jersey	Private recreational angler		Please significantly reduce the total allowable catch
Tyler G Menninger	New Jersey	Private recreational angler		Please stop allowing this over fishing so the rest of the anglers and fish have a chance to survive
Shannon Jacobs	New Jersey	Other (please specify)	Birder	Please strengthen menhaden fishing limits so Ospreys can recover.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Avery Fletcher	New Jersey	Concerned stakeholder		Please take these reductions seriously and in the future consider setting the cap to zero. The Bay Cap on Menhaden impacts the entire ecosystem of the East Coast and the livelihoods of many. There is much more at risk here than the profits of one organization. If the ecosystem is not healthy, we will all be impacted.
Eileen Ferara	New Jersey	Concerned stakeholder		Please work to ensure the bunker fish population is increased to help the rest of the ecosystem such as osprey that rely on the food source
Paul Shafer	New Jersey	Private recreational angler		Problems associated with overfishing are not created all within one year, and their resolution cannot be solved all within a year either. The regular and consistent assessment of such an important resource is critical. In addition, any reduction in the bay should not be "reassigned" to the ocean. Rather, it should be returned to the resource for maximum benefit not only of anglers, but to other fish, mammals, birds of prey, etc. Thank you.
William Rathjen	New Jersey	Private recreational angler		Protect menhaden for the good and need for all marine life

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Margaret Flinner	New Jersey	Other (please specify)	Birder and property owner at Cape May Point	resident and steward of Cape May Point, New Jersey, a place where ospreys are not just something I occasionally see—they are an essential and beloved part of the landscape and of the coastal ecosystem I have watched and cared about for many years. I care deeply about the health of the Atlantic coast and the Chesapeake Bay, and I am especially concerned about the availability of menhaden, a foundational forage fish on which ospreys and many other predators depend. The Atlantic States Marine Fisheries Commission is considering important changes to the Chesapeake Bay menhaden reduction-fishery cap, including reductions of up to 50% and measures that would spread harvest more evenly throughout the fishing season. The Commission itself has recognized concerns about the increasing concentration of reduction harvest during the summer and the potential downstream effects on menhaden predators. (ASMFC) I strongly support taking a precautionary approach. We may not yet have all the science needed to understand the full picture of what is happening with osprey populations along the East Coast. But that uncertainty is precisely why we should not wait until the evidence is unequivocal and the damage is irreversible. When a species that depends so visibly on abundant forage fish appears to be struggling, we should be protecting its food supply rather than continuing to remove large quantities of that food during the very season when it is most important to predators. I urge the Commission to adopt the strongest conservation measures supported by the Draft Addendum, including a substantial reduction in the Chesapeake Bay menhaden reduction-fishery cap and seasonal quota periods that prevent large concentrations of menhaden harvest during critical periods for ospreys and other predators. Menhaden are not simply a commodity. They are part of the ecological foundation of the Atlantic coast. As someone who treasures the living coastal community of Cape May Point, I don't want to imagine a summer without the sight of ospreys circling overhead, carrying fish back to their nests, and teaching their young to fish. Please give the ecosystem—and the ospreys that depend upon it—a margin of safety. I urge the Atlantic States Marine Fisheries Commission to reduce the Chesapeake Bay menhaden harvest and establish seasonal protections that allow menhaden populations to recover and remain available to the wildlife that depends

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Tim Stoessler	New Jersey	Private recreational angler		Reductions must pass !!!!! I'm sure they have a strong lobby... Stand firm, or it will soon be too late to save this vital fish and all others that feed on it
Gabriella Rodriguez	New Jersey	Other (please specify)	save osprey chicks	save osprey chicks
Nicholas Twomey	New Jersey	Private recreational angler		Save the Bay!!! Listen to the science, NOT industry!
Robby fuggi	New Jersey	Private recreational angler		Save the bunker 50% REDUCTION
Gary DeFranco	New Jersey	Private recreational angler		Save the Bunker for our childrens children
Eric Warner	New Jersey	Private recreational angler		Save the bunker please!
Joseph Marchesano	New Jersey	Other (please specify)	Recreational and for hire	Save the fishery! It’s a disgrace that we allow our own and other agencies to decimate such a keystone species.
Tim Riley	New Jersey	Private recreational angler		Save the menhaden! I fish multiple times a week for years and the bait is gone. These thieves have harvested too much. They should all be shut down.
Kathleen Reardon	New Jersey	Concerned stakeholder		Save the ospreys!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Peter J. Kellison	New Jersey	Other (please specify)	Retired for hire deckhand and avid Striper fisherman	Seeing first hand what happens when Bunker is excessively harvested and the food chain is disrupted to both fish stocks,reduced tourism, and fishing related businesses it is imperative that we need to reduce bunker harvest by at least 50%.
Gregory Brand	New Jersey	Concerned stakeholder		Should also commission a study of the wider causes of menhaden die out and its impacts on the ecosystem and other species like osprey, dolphins, tuna, etc. Emergency measures should also be planned out for rapid ecosystem collapse, which is already apparent to observers.
George smith	New Jersey	Private recreational angler		should be no reallocation of any under performance of the catch because it would relate to having fewer fish available to catch.
Anthony Orovio	New Jersey	Private recreational angler		significantly lower the coastal Total Allowable Catch.
Robert W	New Jersey	Private recreational angler		Stop monetizing the waters….. the rich continue to get richer while the eco system suffers and so do the recreational anglers. You do not need to be highly educated or have a plethora of letters after your name to see what is happening
Glen Zeeck	New Jersey	Private recreational angler		Stop ruining our recreational fishery by selling out to foreign countries.
Garth Hutchinson	New Jersey	Concerned stakeholder		Thank you for concerned citizens to comment on this important issue.
Diana R. Hutchinson	New Jersey	Concerned stakeholder		Thank you for receiving these public comments!
Kathleen Goodman	New Jersey	Concerned stakeholder		Thank you for the opportunity to share my feedback.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Andrea Shotkin	New Jersey	Concerned stakeholder		Thank you for your consideration. Please ensure that the reduction fishery is better regulated to allow a large proportion of menhaden to mature and live longer lives (up to 10 years). The Chesapeake Bay needs more, and much larger, fish in the NEAR future for ospreys, which are now suffering terribly, and other organisms that depend on a healthy, populous, and mature menhaden population.
Jeffrey Fedor	New Jersey	Private recreational angler		The coastal total allowable catch must be reduced; please save the fishery
William Roth	New Jersey	Private recreational angler		The commercialharvest by Omega corpoaration needs to be cut down to at 85% of what they are currently allowed.
Rebecca Goldburg	New Jersey	Concerned stakeholder		The economic effects of failing to leave enough menhaden in the water to support the ecosystem are profound - not just for the recreational fishing industry, but also for all the other sectors that depend on the enjoyment of nature up and down the east coast.
Neal Hafner	New Jersey	Private recreational angler		The foundational data behind reduction fishing needs to be revisited to set more accurate targets
Joe Crouchman	New Jersey	Private recreational angler		The menhaden fishery is in extreme danger and this will snowball into a major issue if not resolved now. We need to take action to cap areas so that we do not witness and depleted fishery and we see progress made. The ecosystem is in need of menhaden and we have to protect them at all costs
Mark A. Taylor	New Jersey	Private recreational angler		The need to protect this essential forage fish is urgent. The decisions being made now will have long-term consequences, and we must act before it is too late.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Patricia Hollenack	New Jersey	Other (please specify)	Avid birders upset with the affects of over fishing on the Osprey and Dolphins et al	The Osprey numbers are declining to the point they will be endangered or already are...other species will follow...we must save our nature!!!!
Jay A Trinter	New Jersey	Private recreational angler		The over harvesting of the Menhaden stock must be stoped ! Or every fish and mammal that Depends on them will Die !
Charles Jewell	New Jersey	Private recreational angler		The person who made this survey made it as confusing as possible. Just reduce the amount of bunker harvested to as little as possible. The loss of these forage fish is having a direct impact on the ecosystem of the marine life and its estuaries. The loss of this industry would not be missed and what it provides can be replaced by other means. Reduce its quota as much as possible so I can see an increase in the fish I recreate to catch!!!!
Kathrine Mitchell	New Jersey	Private recreational angler		The quota should be divided to allow the best flourishing of menhaden
Peter Walsifer	New Jersey	Private recreational angler		The reduction fishery is detrimental to the entire coastal ecosystem from Maine to Florida. We must do every thing in our power to greatly curtail or eliminate all together this destructive practice.
Richie Mansfield	New Jersey	Private recreational angler		The Shortage Of Bunker Is Destroying The Inshore Recreational Fishing No Tuna Last Few Years Striped Bass Fishing Is A Joke We Need More Bunker See No whales Either

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Don	New Jersey	Other (please specify)	Former charter boat captain/owner	The Virginia menhaden boats have been vacuuming our Menhaden for over 50 years with virtually no restrictions in the 60s or 70s. Back then, they would net them at the waters edge. If you were fishing the beach, you risked getting caught up in their nets. The inshore fisheries have suffered for years. It's time for them to have some lean years!
Thomas Kowitski	New Jersey	For-hire vessel owner/operator/crew		There have been significantly less adult menhaden in the NJ coastal waters this year (2026) so I see a need for at least a 50% reduction in the TAC.
Joseph E. Koscielny	New Jersey	Concerned stakeholder		There is a definite need for the reduction of Bay Cap limits in order to provide for the future of the Menhaden, rather than see their future extinction. The impact of the loss of the Menhaden would definitely have an impact on the fisheries and survival of the whales, striped bass, ospreys and other sea life. We need to act now before it is too late to reverse the dangerous effects of current inaction that would allow the adverse affects of inactivity.
Karen Nickeson	New Jersey	Other (please specify)	Conservation Director managing Osprey monitors	There is an exigent need to preserve the fishery for the industry, but also for the Osprey population and other wildlife that depend on this food source.
Sharon Coughlin	New Jersey	Concerned stakeholder		there seems to be a serious problem with overfishing of menhaden. we need to cut back on the overfishing, protecting the fish so that populations do not collapse, allowing the ecosystem to function properly, protecting wildlife that depend on these fish in order to reproduce and survive. we cannot let the ecosystem collapse. we cannot let any species go extinct.
Harold Wasserman	New Jersey	Private recreational angler		There were literally miles of Bunker in the New York Bight in prior years. Now there are NONE. Omega Protein and others have decimated the Menhaden population to the point where they can no longer meet their harvests.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kristin S	New Jersey	Concerned stakeholder		these options best support the Chesapeake Bay and ensure the health of our birds, people, and coasts.
Carol Ann Welsch	New Jersey	Concerned stakeholder		These options will help protect the ospreys of the Chesapeake Bay, which are suffering from serious rates of nest failure.
Tim Waller	New Jersey	Private recreational angler		This fish is a keystone of the atlantic and gulf marine environment. As current regulations are enforced we have watched our fisheries decline hand over fin. Not only are game fish species impacted but the entirety of our atlantic and gulf ecosystems stand to benefit before we completely rip the scales to irreversible harm.
John Tefankjian	New Jersey	Other (please specify)	Recreational fisherman/ Osprey volunteer	This has become a coastwide issue affecting, wildlife , Marine and Avian, Bad fisheries management and poor decisions got us to here , let's make better decisions based upon actual observations , please stop letting financial and political decisions guide us in the wrong direction! Thank you
Matthew Szatkowski	New Jersey	Private recreational angler		This needs to be addressed and action needs to be taken to reduce the harvest with extra attention the Chesapeake bay
James Connell	New Jersey	Private recreational angler		This survey questions are confusing. The bottom line is the menhaden population in the areas I fish (De to ME) from boat or the beach, bay or ocean have diminished greatly. Although my observations are anecdotal, they are accurate. I have found multiple dead osprey in the nesting areas of NJ and the striped bass and bluefish are no longer here in any significant numbers.
Martin Fletcher	New Jersey	Concerned stakeholder		Thousands of people rely on the health of our East Coast ecosystem from the fishing vessels to the support services to the restaurants and recreational fishing industry. The entire economy needs to be considered not just the extraction companies. Please reduce the Bay Cap as much as possible and consider further reductions in the future. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Melissa Laurino	New Jersey	Other (please specify)	Marine mammal ecotour provider and marine mammal scientist	Management Board: On behalf of the Cape May Whale Watch & Research Center (CMWWRC), I appreciate the opportunity to provide public comment on Draft Addendum II to Amendment 3 of the Interstate Fishery Management Plan for Atlantic Menhaden. For nearly four decades, CMWWRC has operated whale and dolphin ecotourism and research programs off Cape May, New Jersey. Through systematic data collection aboard our vessels, we have documented marine mammals and other marine megafauna that utilize the coastal waters of southern New Jersey and the southernmost area of the New York Bight. Spending 200 days on the water a year has granted us a firsthand perspective on the importance of healthy bait fish communities to this highly productive marine ecosystem. Atlantic menhaden (Brevoortia tyrannus) are considered the most important fish of the sea. They play a valuable role in our coastal food web and provide food for marine mammals, pelagic seabirds, ospreys, sharks, and large predatory fish. The ASMFC recognizes marine mammals among the predators supported by Atlantic menhaden. We have documented Humpback whales (Megaptera novaeangliae) and Tamanend's Bottlenose dolphins (Tursiops erebennus) regularly feeding on Atlantic menhaden throughout the year. We have observed a noticable decline in the surface presence of Atlantic menhaden over the last ten years in the Atlantic Ocean and the Delaware Bay. We recognize that the coastwide Atlantic menhaden stock is currently classified by ASMFC as not overfished and that overfishing is not occurring under the current ecological reference points. At the same time, ASMFC notes that the coastwide assessment cannot determine menhaden abundance at smaller regional scales such as Chesapeake Bay, and therefore not the Delaware Bay either. For highly migratory predators, the location and timing of prey availability can be ecologically important even when a prey stock is considered "healthy" at the larger scale. For this reason, we encourage the Management Board to give substantial consideration to the ecological role of Atlantic menhaden, localized and seasonal forage availability, and the needs of marine predators throughout the Mid-Atlantic ecosystem. The Mid-Atlantic waters support whales, dolphins, pelagic seabirds, ospreys, sharks, and economically important fishes. Protecting the forage base that supports these animals is an important component of

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Scarlett Blydenburgh	New Jersey	Concerned stakeholder		Unprecedented osprey chick starvation and reproductive failures in the Chesapeake Bay are directly linked to a shortage of Atlantic menhaden, driven largely by large-scale industrial reduction fishing. Menhaden is a critical food source for ospreys, along with predatory fish (such as striped bass, bluefish, tuna, and sharks), and marine mammals (including whales and dolphins). Menhaden supports coastal ecosystems and coastal economies, but simply put, the fisheries catch levels have exceeded the ecological overfishing threshold. Personally, I see ospreys coming back from offshore with either small fish or no fish at all, so this issue needs to be addressed immediately. I support a full moratorium to menhaden fishing.
Captain Peter Grimbilas	New Jersey	Private recreational angler		We desperately need the total allowable commercial catch reduced to help bring back striped bass and bluefish stocks
Daniel Thompson	New Jersey	Concerned stakeholder		We first settled in the area 35 years ago. The fishing at East Point was so plentiful that we had to get to East Point at 7 AM to get a parking spot and we would actually catch fish. Now it's a ghost town there. No fish, nobody there. I have several friends with small boats who tell me it's a waste of time to go fishing anymore. There are no fish to catch anymore.
Nick foell	New Jersey	Concerned stakeholder		We need to do everything we can to help the osprey
Rachel Grace	New Jersey	Concerned stakeholder		We need to do what is best for biodiversity - which would be to reduce the harvest numbers allowed, and give ospreys and all the other marine life a fair chance at survival.
Kevin	New Jersey	Private recreational angler		We need to reduce the overall number of fish harvested each year drastically, even if that means stopping harvesting for a few years. The ecosystem is collapsing from osprey to striper we are seeing a dramatic decline in populations. Now might be our only chance to save these animals.
Brian walters	New Jersey	Private recreational angler		We need to stop over harvesting bunker. They are the primary resource for so many game fish and migratory birds such as osprey which had their worst recruitment too date

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Aidan Griffiths	New Jersey	Concerned stakeholder		While reducing commercial harvest of Menhaden for local fisherman is now a necessary measure to allow the adult population to rebound, the major issue that caused the most egregious over harvesting is not addressed by this addendum (that being the Canadian Omega corporation's harvest in Federal waters). If Federal measures are taken to stop Omega's activities in the mid-Atlantic, local fishermen will not have to bear as much of the burden of protecting the fish stock.
Kevin Papa	New Jersey	Private recreational angler		You are allowing the destruction of our local food systems by permitting such a massive menhaden harvest. In my opinion, it should be far higher than even 50% reduction.
Joel Sklar	New Jersey	Other (please specify)		Concerned citizen who wants to protect Ospreys
Emery Thul	New Jersey	Other (please specify)		Concerned stakeholder worried about the impact on Osprey populations.
Gail Morchel	New Jersey	Other (please specify)		I have a boat in Osprey Point Inn and Marina Rock hall, Maryland. I enjoy the Osprey at the Marina. I am .
Andrea	New Jersey	Other (please specify)		Concerned for ospreys
Joan	New Jersey	Other (please specify)		A beach resident and wildlife supporter and particularly concerned with decreasing osprey survival
Tracie Muir	New Jersey	Other (please specify)		Own in Edgewater, MD along the water and noticed a decline in osprey

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Claire Rodriguez	New Mexico	Other (please specify)		I live on this planet and care about the food web.
Daniel Brown	New York	Private recreational angler		Menhaden is the most important fish in the sea and should be treated as such.
Robert Rapisarda	New York	Private recreational angler		“Please significantly lower the coastal Total Allowable Catch (TAC) to a level that ensures that striped bass can rebuild quickly and so that the coastal ecosystem has a abundance of bunker for all creatures to thrive”
Anne Lazarus	New York	Other (please specify)	none, I am a birder.	A lot of the fishing for Manhaden goes to pet food as well. They are literally sweeping out the ocean. Whales and other marine species are also suffering from this overfishing. The ecology supporting Ospreys and other life will be devastated if this overfishing is not stopped. Manhaden are keystone to saving the ecology. Ospreys are important, and the destruction is before our eyes. Other species harmed and pushed toward extirpation can be invisible to our eyes. This extreme overfishing needs to be stopped now, or the whole ecology of the area will collapse. I am also thinking of dolphins and seals.
Juan jose	New York	Private recreational angler		All I got it said is this should be regulated just like fishing cause if we don’t. We not going to be catching fish the feeds on this bait fish
Richard F Grein	New York	Private recreational angler		As a concerned fisherman, I’ve watched the schools of bunker dwindle and the almost complete disappearance of river Herring in my area. We have to stop this from becoming a cost wide issue. And help rebuild from the past assessment errors and harvests. The reductions also should come from harvest numbers and not quotas. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Daniel Franc	New York	Other (please specify)	An avid birder who has witnessed a sharp decline in osprey population.	As a lifelong fisherman AND birder. I have witnessed the decline of the fishery and now the birds. Action must be taken.
Lina Sinishtaj	New York	Private recreational angler		As a recreational angler, it's better for the environment and for local economies to keep the menhaden protected. Large businesses pillaging the resources does not help anyone except for the 1%.
Larry Federman	New York	Other (please specify)	Concerned stakeholder whose interest in protecting food supplies for Osprey and other birds and wildlife depending on menhaden stocks.	As we've seen successful measures to protect migrating shorebirds by regulating horseshoe crab egg harvests, a strong protection program for menhaden is critical to reverse the decline of Osprey breeding success in the Chesapeake Bay watershed. Thanks for the opportunity to comment.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jonathan Agosta	New York	Private recreational angler		Atlantic Menhaden is one of the most important species of bait fish for a myriad of species - fisheries and otherwise - across the East Coast. The Atlantic Menhaden fishery has been grossly mismanaged for far too long. Every action should be taken to conserve this species and limit the reduction fishery. The economic benefit of the reduction fishery falls several orders of magnitude short of the economic importance that this species represents across numerous other fisheries.
Richard Bertoli	New York	Private recreational angler		Atlantic Menhaden: literally the most important fish in the sea
Eric Radoman	New York	Private recreational angler		Have not seen large schools of Bunker in 3 years
Laura Desmarais	New York	Concerned stakeholder		I am a resident of both NY and CT and have personally observed both the dramatic reduction in menhaden in the Long Island Sound and its apparent effect on local osprey population. I have also heard from fishermen whose fishing lives are disrupted from this reduction. I strongly urge you to adopt the strongest option presented: a 50% reduction to the Bay cap, tied to the coastwide cap, and split seasonally (25/25/50) so as to minimize the impact during osprey nesting season. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Emelie Einhorn	New York	Concerned stakeholder		I am writing in as a concerned ecologist. The menhaden of the Bay are being overharvested by commercial fishing vessels. Private industry is causing the menhaden populations to collapse so they can sell fish oil to consumers across the globe. Meanwhile the local ecosystems are suffering. Osprey in particular, which have historically made a recovery from the impacts of DDT in the 60's, are now in serious decline due to their primary prey being removed from the environment. Menhaden are often harvested for fish oil, which is typically a sham supplement and doesn't actually benefit human health in many of the ways it is advertised to. Realistically a moratorium on commercial fishing would be the best option to allow menhaden populations to recover, but seeing as the ASMFC isn't currently entertaining that as an option, the 50% cap reduction is the next best option. A majority of commercial fisheries have collapsed in the last century, and ensuring the longevity of menhaden populations is significantly more important than short-term profit. Overharvesting can permanently collapse a fishery - just look at wild Atlantic salmon - and the cascading environmental and economic effects would be significantly greater should that occur than a 50% reduction. Please consider the long-term prospects of both the menhaden population and all the wildlife that depend specifically on the presence of oily fish for the nutritional needs they have evolutionarily adapted to. Continued overharvesting of menhaden, the current status quo, would be a death knell for regional osprey populations in particular. Thank you for your attention to this matter.
Mike Viola	New York	Private recreational angler		I have been fishing for 40+ years in the Long Island Sound area and over the past 3 years I have continued to see a drastic reduction in menhaden in the local waters. Bunker are basically non-existent throughout the sound. This is having ripple effects to the other fisheries as food sources are not readily available for predatory fish such as Striped bass. Action needs to be taken before it is too late!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
John Mlodynia	New York	Private recreational angler		I implore the board to adopt measures that drastically reduce the take of Bunker especially by Omega Protein from Virginia. I believe there should be no bunker harvest by purse seine in Chesepeake Bay and not within 3 miles of Virginias Coast. Omega Protein has decimated the bunker population and we have been seeing a drastic decrease in bunker on the entire Atlantic Coast. Omega Protein has fished the Chesepeake Bay into a wasteland and it needs to stop immediately. Ospreys, Striped Bass, Marine Mammals are all starving for this vital food source that cannot be found for huge swaths of the coast. I encourage the board to have the courage to put a stop to this destructive fishery forever and save the most important fish in the sea. Thank you.
Michael Noville	New York	Concerned stakeholder		I support saving the osprey in the Chesapeake Bay.
Ann Kelly	New York	Private recreational angler		If 50% of our osprey new population didn't survive reproduction then drastic measures need to be taken now to help them recover. Isn't that obvious?
Katherine Drouin-Keith	New York	Other (please specify)	Birdwatcher and nature enthusiast	I'm very alarmed about the declining osprey population on Long Island. We fought so hard to ban DDT and bring them back in the 1970s, and it's important to keep supporting them.
Marianne Poteet	New York	Concerned stakeholder		It is important that we co-exist with wildlife.
Max chronister	New York	Private recreational angler		It shouldn't have gotten to this point
M	New York	Concerned stakeholder		Just let the Osprey have more fucking fish for their chick's. Nesting, I believe is May through maybe August. New York has seen large increase is Osprey numbers. Just fucking do similar.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Pamela Brocious	New York	Concerned stakeholder		Many species depend on Menhaden for their lives. We can source other proteins for fish/pet food rather than live fish. Let's support our local environments. Collectively, these choices support lowering menhaden's Chesapeake Bay cap to 50% of the current 51,000 metric ton fishing limit. They also break the fishing season into three "quota" periods, so Osprey won't need to compete as much for food during the most vulnerable times of their life cycles. And to give the Commission the ability to plan and react to changing conditions, the Chesapeake Bay cap would be reviewed every 3 years.
Mike murray	New York	Private recreational angler		Marine ecosystem collapse is worse than humans losing jobs - they can find another job
June Summers	New York	Other (please specify)	Environmentalist, who spends time on the coast of Maine.	Menhaden are too important to the ecosystem to allow their population to fall so low. Looking at only one predator population to predict population of menhaden might not be the best way to do it. Blue fish also prey on menhaden and the few fishermen in Maine that I spoke with said they hadn't seen any blue fish in a long time.
Filipe Gomes	New York	Private recreational angler		Menhaden is one of the most vital part of our ecosystem it cannot be over fished
Jackie Stephens	New York	Other (please specify)	Concerned public	Menhaden must be protected for all living creatures they sustain.
Eric M	New York	Private recreational angler		Menhaden need to be made more of a priority by managers and the Board. There are too many issues with your models that make “paper fish” that aren’t real. The ecosystem is depleted of menhaden and it shows in so many ways to us on the water. Regulations need to be more cautious and tight to prevent overfishing and allow the menhaden to stay at sustainable levels to support the many species that rely on them.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Peter Leary	New York	Private recreational angler		Menhaden need to be protected as they are the cornerstone of our oceans ecosystem from southern Florida to northern main. For recreational fishing, marine mammals, shellfish. Everything.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Christopher Reigel	New York	Private recreational angler		primary production to higher trophic levels. Commercially and recreationally important fishes, including striped bass, bluefish, spiny dogfish, and bluefin tuna, are all known predators of Atlantic menhaden (Anstead et al. 2021). Avian predators, including osprey and bald eagles, also feed on seasonal menhaden aggregations, as do sharks, weakfish, and marine mammals including bottlenose dolphins and humpback whales (Ahrenholz 1991; Anstead et al. 2021). For each of these species, menhaden schools represent a predictable, energy-rich prey source that is particularly exploitable in nearshore habitats during their seasonal migrations. Predator health and recruitment have been tied to menhaden abundance in estuarine environments (Uphoff 2003). Decreased menhaden populations were implicated in the depressed nutritional state, fluctuations in weight-at-length and weight-at-age averages, and spread of disease observed in Chesapeake Bay striped bass during the late 1990s (Uphoff 2003). The presence of stable menhaden populations has also been identified as a potential predictor of nesting success and productivity in osprey in the lower Chesapeake Bay (Academia and Watts 2023; Watts et al. 2024). These cascading trophic interactions highlight the importance of maintaining adequate menhaden abundance throughout coastal and estuarine ecosystems. Their abundance supports the feeding demands of a large and diverse predator base, and documented shifts in menhaden abundance have been associated with impacts on the health and productivity of upper-trophic-level populations within their communities. Estuaries including the Chesapeake Bay serve as important nursery habitat for menhaden, but environmental conditions within the Bay are also changing. Summertime temperatures in the Chesapeake Bay have risen steadily since the 1980s, while the volume and duration of summertime hypoxia have also increased (Nelson et al. 2025). These environmental changes may impose additional physiological and ecological pressures on menhaden populations within the Bay. Draft Addendum II is a response to growing concerns over declining pound-net harvest and reduced catch per unit effort in the Chesapeake Bay. These declines, considered in the context of environmental degradation and continued fishing pressure, warrant a precautionary management response. Where environmental conditions are becoming increasingly challenging,

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Benjamin Manley	New York	Other (please specify)	Someone concerned about wildlife.	Moderation needs to be considered. The current model is unfair.
Trevor Benevento	New York	Private recreational angler		My name is Trevor Benevento. I've been fishing my entire life 30 years. Over the course of these years myself and all recreational anglers have seen a decline in bait present along long islands beaches. What was once a fantastic fishery has dwindled into close to nothing. Fishing is something that brings in much of long islands annual revenue, and much of what the average person lives there life from. The foreign and US bunker boats are destroying the fishery's. This needs to be changed as of immediate.
Margarita	New York	Other (please specify)	Fish advocate	No
Troy	New York	Concerned stakeholder		No
Astrid Jarvis	New York	Other (please specify)	Promote environmental justice, concerned about fishing as related to climate and environmental issues.	No
Shaeril McBrown	New York	Concerned stakeholder		No

William Theodoropoulos	New York	Private recreational angler		No
Meredith Kent-Berman	New York	Other (please specify)	None.	No.
Thomas Weickert	New York	Concerned stakeholder		none
Amy Simmons	New York	Concerned stakeholder		Not at this time.
Mary Troland	New York	Concerned stakeholder		Osprey rely on menhaden so please manage your fish stock carefully. Thank you.
Sierra Duca	New York	Concerned stakeholder		Ospreys are crucial indicators of ecological health, and their declining reproductive success signals massive ecological disruption linked to menhaden overfishing. Immediate government action is essential to restore menhaden populations and protect the entire Chesapeake Bay ecosystem.
robert dawson	New York	Private recreational angler		Please do something about this. please. its has been really bad for the last few years. no bunker by me at all and historically there are so many.
Bridget Lavender	New York	Concerned stakeholder		Please help protect wildlife for all of us!
Jonathan	New York	Private recreational angler		Please keep the ecosystem and the people who do the right thing to conserve our fishery!
June Fox	New York	Concerned stakeholder		Please protect the ospreys ! Too many birds are going extinct due to human activity.
Ross Squire	New York	Private recreational angler		Please reduce the TAC to support the viability of striped bass and other species that rely on menhaden as a primary source of food.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Sailor Cook	New York	Other (please specify)	Wildlife lover	Please save the Osprey
John Bowman	New York			Please significantly lower the coastal Total Allowable Catch (TAC) to a level that ensures that striped bass can rebuild quickly and so that the coastal ecosystem has a abundance of bunker for all creatures to thrive”
Anthony Criscuola	New York	Private recreational angler		Please significantly lower the coastal Total Allowable Catch (TAC) to a level that ensures that striped bass can rebuild quickly and so that the coastal ecosystem has an abundance of bunker for all creatures to thrive
Hussam gouda	New York	Private recreational angler		Reduce the quota for all of the menhaden fisheries on the Atlantic coast. They are the backbone of the ecosystem, and if their populations crash the rest of the ecosystem will too
Logan Douglas	New York	Private recreational angler		Save the bunker
Nuno decosta	New York	Private recreational angler		Save the bunker
Andrew	New York	Private recreational angler		stop killing all the bunker
Mary Anne Miller	New York	Other (please specify)	concerned osprey nest monitor	Thank you for allowing the public to weigh in on this important issue. Something has to be done before the menhaden are gone from the Bay..and the east coast.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Matthew Garczynski	New York	Concerned stakeholder		Thank you for soliciting comments on Draft Addendum II. Menhaden are a keystone species to coastal wildlife, as well as a critical forage fish that many of our bait fisheries, coastal communities, and small businesses rely on. In observable correlation to a decline in menhaden, the osprey population has struggled in recent years. It has become clear that a healthy menhaden population is critical to the health of the entire Chesapeake Bay ecosystem.
Christopher Albronda	New York	For-hire vessel owner/operator/crew		The current limits and regulations are destroying a once thriving fishery. Lower, the quotas across the board,
John Isgro	New York	Private recreational angler		The fish populations are so drastically down it is literally insane. I have not seen schools of adult bunker in Long Island sound in 3 years. This commercial harvesting absolutely need to be regulated and harvests by industrial fertilizer companies must be stopped. If proper actions are not taken, there will be dramatic, severe revolt and damages done. Mark my words.
Jennifer Wilson Pines	New York	Other (please specify)	Audubon chapter president on Long Island	The impact is also being seen on the south shore of Long Island and New Jersey with diminishing productivity in successful fledging of Osprey. Serious studies need to be done so that the Committee can make a decision based on science
Maryanne Adams	New York	Concerned stakeholder		The importance of menhaden for a healthy ecosystem cannot be emphasized enough. These fish are not just a cash cow for the fishing industry. Their role as a vital food source for osprey, for example, needs to be considered when proposing a management plan. Please keep the importance of menhaden to other life forms in mind when making recommendations about taking them out of the food chain.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Luka Rodriguez	New York	Other (please specify)	Frequenter of Atlantic shores	The overfishing of our Atlantic waters is killing not only killing ospreys, but damaging the microbial communities and ecosystems of the ocean. This will lead to the demise of the current balance of nature in the Atlantic, eventually causing damage to humans and ruining the beautiful nature we cherish and spend our free time in. Do not take nature for granted and take without ever giving back.
Cathy McConnell	New York	Concerned stakeholder		The return of the Osprey has been an inspiring conservation victory. Let's not let them down now! Especially if the only reason they are starving is that their food is being taken to create fish meal!
Mike Mcloughlin	New York	Private recreational angler		there should be a 5 year moratorium on any bunker harventing to let all the stocks rebound and reassess the state of all the fisheries then and not put corporate profits over our ocean
Kimberly Williams	New York	Private recreational angler		There should be zero roll over of unused quota except for unusual circumstances that prevented boats from fishing. If we can't catch fish because they are unavailable, then that is telling us something important that has not yet been picked up by stick assessments that have a multi-year lag. If you can't catch fish because they are not there, it's rediculous to allow more to be caught the next quota period. Also the season should start later to allow fish to grow larger, move around the bay, and be available for predators. ASMFC needs to let menhaden live longer and grow larger. If it was technically feasible I would be suggesting a size limit minimum of 8 inches total length to correspond with size of 50% maturity. ASMFC needs to stop confusing targets and thresholds. Be responsible and manage to the targets.
Matthew Spataro	New York	Private recreational angler		There's no bunker!!!!!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Timothy Kennedy Regan	New York	Other (please specify)	Marine Wildlife Cinematographer - menhaden, whales, sharks, fish	These options are way too lax. Menhaden is known as the most important fish in the sea, not due to its monetary value, but because of its contributions to each ecosystem that hosts the fish. Harvesting this public resource at the current unsustainable rate should be deemed criminal. It is frankly inappropriate to consider any approach which does not guarantee at least a 75% of rebuilding this biomass.
Susanne Fordham	New York	Concerned stakeholder		This is critically important. It's right up there with DDT and the urgency needed to address immediately. We can't wait for another nesting season to FAIL like it did this year!
Frances Greenberg	New York	Concerned stakeholder		We must act to preserve the Bay against overfishing
Matt	New York	For-hire vessel owner/operator/crew		We need to do something and fast. It should've been done years ago, but God willing we have an opportunity to salvage our current situation now; and need to take advantage and reduce the quota by 50%. That is the only option that will possibly save our fisheries
Christopher Gagnon	New York	Private recreational angler		Why allow a foreign (Canadian) company fish in American waters at all? Reduction fishery by this company should not be allowed!
John Conboy	New York	Other (please specify)	Wildlife conservation	Why do you make this so difficult. Just ban industrial fishing for menhaden. Simple. Get rid of the omega boats.
Raphael Wakefield	New York	Private recreational angler		With atlantic menhaden stocks and hauls dropping, it is imperative to at least try to reduce take until such time as this has been proven ineffective or the fish stocks grow. The decline in ospreys that birdwatchers have observed are a warning signal that should be taken seriously
Joe Bragan	New York	Private recreational angler		Yes, more needs to be done in regard to the purse seining happening off NJ and Nay waters.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James Jones	New York	Other (please specify)		I study osprey which rely on bunker!
norma sloane	New York	Other (please specify)		interested in osprey
Mary A Weber	New York	Other (please specify)		concerned voter, love biodiversity
Jean Norris	North Carolina	Other (please specify)	Recent visitor to Maine, impressed by lobster fishing	Helping the ospreys will add some protection for the entire ecosystem. It may end up being the reason the fishery survives. Plan for detecting, and discouraging, poaching.
Ann Christensen	North Carolina	Concerned stakeholder		I am a former resident of Maryland and lived on Chesapeake Bay. It is important to carefully manage that ecosystem to protect the ospreys and all the other species dependent on a properly functioning ecosystem.
John Willis	North Carolina	Private recreational angler		I want the greatest reduction in menhaden harvest in the bay as possible. It is crazy to put all this fishing pressure on such an important fish for the ecosystem.
Daphne McKibben	North Carolina	Other (please specify)	I just am trying to protect ospreys, and therefore fish	Please save these fish. If the fish die, all the coast ospreys will as well, resulting in a severe decline of many species. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
John DeLuca	North Carolina	Concerned stakeholder		Please strengthen menhaden fishing limits so Ospreys can recover and that coastal ecosystems continue to function.
Colt	North Carolina	Other (please specify)	Conservationist, sportsman, fisherman, & extremely concerned about the declining osprey population. In NC we have to deal with trawling in the estuaries…. We understand directly how telling osprey populations are.	Protect our water. Ospreys tell us how
Cynthia Sampson	North Carolina	Concerned stakeholder		Thank you for giving me the opportunity to participate in this survey. I care about it deeply. Best regards, Cynthia Sampson

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Amelia Boyer	North Carolina	Concerned stakeholder		The menhaden fishery has been poorly managed for years. The impacts up and down the food chain has impacts on us too. With thoughtful management I hope this problem can finally be addressed.
WILLIAM YOUNTS	North Carolina	Concerned stakeholder		these choices support lowering menhaden's Chesapeake Bay cap to 50% of the current 51,000 metric ton fishing limit. They also break the fishing season into three "quota" periods, so Osprey won't need to compete as much for food during the most vulnerable times of their life cycles. And to give the Commission the ability to plan and react to changing conditions, the Chesapeake Bay cap would be reviewed every 3 years.
Jared L Saum	North Carolina	Private recreational angler		This fish is the lifeblood of the entire eastern seaboard fishery. I urge you to reduce the catch
Terrence Ginn	North Carolina	Private recreational angler		You need to stop kicking the can down the road. The Chesapeake Bay Menhaden population is the last viable population along the eastern seaboard than can repopulate the resource on the east coast. It affects way more than Virginia! The loss of the menhaden biomass along the eastern seaboard has decimated many fisheries that rely on menhaden as their food source, not to mention the effects on the bird population and reduction in water quality that is caused by the reduction of the menhaden biomass. Please recognize the incredible importance of menhaden in the food chain that so many other species need to survive.
Colt	North Carolina	Other (please specify)		Sportsman, fisherman, & extremely concerned conservationist. Ospreys are a direct tell of our fisheries
Kelly Levenda	Oregon	Concerned stakeholder		N/a
Risa M Mandell	Pennsylvania	Concerned stakeholder		I'd prefer that we humans let fish be and live their lives. We don't need them for nutrition, see pcrm.org and https://www.bryant-terry.com/books. i don't regard fishing as a sport since it's hardly a level playing field: Fish and other animals don't have opposable thumbs or a prefrontal cortex comparable to ours - therefore, foul play. Thank you for including this field for additional comments.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
William Lytle	Pennsylvania	Private recreational angler		American fisheries should benefit American companies and communities.
Alison Ames	Pennsylvania	Concerned stakeholder		As this is a conservation measure, conservation groups and advocates thereof must have the final say.
James Suleski	Pennsylvania	Private recreational angler		CUT MENHEDEN HARVEST AS MUCH AS POSSIBLE OUR ENTIRE INSHORE ECOSYSTEMS ARE COLLAPSING!!! WHAT THE HELL ARE WE WAITING FOR LOOK AT WEAKFISH STOCKS, STRIPER RECRUITMENT, AND OSPREYS!!!
Nanci Sarcinello	Pennsylvania	Concerned stakeholder		For question 8 I do NOT want status quo. Beyond that I don't understand enough in questions 8-10 enough to make specific choices. For question 8 I want seasonal time periods and caps arranged so that the taking of menhaden will have the least adverse impact on the fishery and other predators.
Rodger Waldman	Pennsylvania	Concerned stakeholder		https://www.sciencedirect.com/science/article/pii/S0165783626002183?via%3Dihub
Ann Myers	Pennsylvania	Other (please specify)	Birder	I have seen the decline in osprey babies.
Jason Kirschner	Pennsylvania			I selected these options for the least fishing, but in actuality I want no fishing, for the sake of the menhadens and the species that depend on them — from birds to whales — and because the Chesapeake Bay serves as a nursery for many of these animals. The Commission should consider the interests of all, not solely those who fish.
Roberta Petusky	Pennsylvania	Concerned stakeholder		I trust all the testimonies by the fishing community in favor of supporting a strong predator-prey relationship. Menhaden is essential for supporting weakened ecosystems and fisheries across the east coast.
Hannah Malfitano	Pennsylvania	Concerned stakeholder		I would prefer a moratorium followed by a 50% reduction

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Janet Toole	Pennsylvania	Concerned stakeholder		I've made my selections in the survey for the least fishing but, in actuality, want no fishing, for the sake of the menhadens and because this fishing will disrupt the ecosystem by reducing the amount of fish "food" available to other types of fish. I believe the Commission should consider the interests of all and not solely those who fish.
Robin Queenan	Pennsylvania	Concerned stakeholder		If we let corporations set their own ethics and moral judgement for what is fair they will use all the natural resources available as quickly as possible. It's the public's job to make sure wildlife and birds who also depend on those resources get enough to survive. There is no way to reverse extinction. Thank you very much. I am grateful to you.
Mary prosser	Pennsylvania	Other (please specify)	Concerned citizen	One of the most thrilling sights is to see osprey dive into the water, and come out with a fish. Nature must be protected, because when it's gone, it's gone.
Liz Brensinger	Pennsylvania	Other (please specify)	Conservationist / birder very concerned about the decline of Osprey populations around the Chesapeake Bay	Osprey came close to extinction during the 1960s, but fortunately their populations rebounded after the banning of DDT. Now, according to the American Bird Conservancy, Osprey nesting success in the Bay is at its lowest level ever recorded — even lower than during the height of the DDT crisis. An estimated 5,000 Osprey chicks are starving to death each year around the Chesapeake Bay, according to ABC, with overfishing of menhaden being the main culprit. Please take action to support the health of Osprey populations and the overall health of the bay ecosystem. Thank you.
Landon Moore	Pennsylvania	Private recreational angler		Please also significantly lower the coastal total allowable catch

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ryan loughlin	Pennsylvania	Private recreational angler		Please also significantly lower the TAC
Grace MacNeill	Pennsylvania	Concerned stakeholder		Please ensure all species reliant on menhaden are protected.
John Carbutt	Pennsylvania			Please lower the quota for the health of this amazing estuary!
Elliot Gerber	Pennsylvania	Private recreational angler		Save the Osprey, Save the Rockfish which have been decimated.
Kathleen Juracka	Pennsylvania	Private recreational angler		Thanks for the opportunity to give opinions.
Aaron Blair	Pennsylvania	Private recreational angler		The Chesapeake Bay is menhaden population is declining and the species that depend on them for forage along with them. To save our striped bass fishery and dwindling osprey populations of the mid and lower-bay, the menhaden quotas should be reduced to the maximum extent for a three year period, after which time the stocks can be reevaluated.
Mary Krupa	Pennsylvania	Concerned stakeholder		The Commission must act now before menhaden populations collapse any further. A healthy menhaden fishery is critical to the livelihoods of thousands of people and contributes millions of dollars to local economies. Our fisheries are a public resource that need to be shared and stewarded for future generations. Allowing one foreign company which employs only a few hundred people to grind up the vast majority of this 'most important fish in the ocean' is reckless. Quotas have to change now.
Carole Ackelson	Pennsylvania	Other (please specify)	Concerned Citizen	These choices support lowering menhaden's Chesapeake Bay cap to 50% of the current 51,000 metric ton fishing limit. They also break the fishing season into three "quota" periods, so animals won't need to compete as much for food during the most vulnerable times of their life cycles. And to give the Commission the ability to plan and react to changing conditions, the Chesapeake Bay cap would be reviewed every 3 years.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jennifer Chapman	Pennsylvania	Concerned stakeholder		Management Board: I am a Pennsylvania resident, conservationist, and avid bird watcher, and I am writing as an individual citizen who cares deeply about the health of the Chesapeake Bay and Atlantic Coast. I grew up near the Chesapeake Bay in Maryland, and the Bay has been an important part of my life for as long as I can remember. I continue to spend time throughout the Chesapeake region and regularly visit the Atlantic Coast, including the Delaware beaches and New Jersey Shore. As someone who spends a great deal of time observing birds and wildlife in these ecosystems, I have a personal stake in ensuring that the forage base supporting these species remains healthy and abundant. I strongly support reducing the Chesapeake Bay reduction fishery cap by up to 50% and establishing a dynamic Bay cap tied to a fixed percentage of the coastwide Total Allowable Catch (TAC), such as 13.6%. I urge the Management Board to adopt these protections rather than treating the Chesapeake Bay as a separate reservoir of menhaden available for intensive harvest. The Bay cap should be directly connected to coastwide management. If the coastwide TAC changes, the Bay cap should change proportionally. A dynamic cap tied to a fixed percentage of the coastwide TAC would prevent the Chesapeake from experiencing a disproportionate increase in harvest pressure simply because coastwide quotas have changed. The Bay is not an isolated fishery; it is a critical component of a larger coastal ecosystem. Its management should reflect that reality. I also strongly support an option to reduce the Bay reduction cap by 50% and establish strict seasonal or split-period allocations. Harvest pressure should not be concentrated into a single season or short period when menhaden are particularly important to predators and the broader food web. Spreading harvest over defined periods—and reducing the overall amount available for reduction fishing—would provide greater protection against concentrated fishing mortality and help preserve menhaden when and where they are most ecologically valuable. This is fundamentally an ecosystem issue. Menhaden are forage fish, and their value cannot be measured solely by the pounds available for reduction harvest. They are an essential food source for striped bass, ospreys, marine mammals, and numerous other predators. When management removes large quantities of a forage species from an ecosystem, the question

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Linda Rowan	Pennsylvania	Other (please specify)		Bird watcher concerned about Osprey that rely on Menhaden as a food source.
Amy Langman	Pennsylvania	Other (please specify)		Birder and one who believes greed never solves anything
Linda L. Campbell	Pennsylvania	Other (please specify)		Private citizen concerned about the balance in nature and maintaining food supplies for various fish species
Perry Kendall	Pennsylvania	Other (please specify)		Concerned about our environment
Summer	Pennsylvania	Other (please specify)		I want to protect their predators and them.
Judy Kramer	Pennsylvania	Other (please specify)		Osprey supporter
Debra metzger	Pennsylvania	Other (please specify)		I care about the environment.
Kim E Soroko	Pennsylvania	Other (please specify)		I'm concerned about wildlife and our planets well being

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Steve chafee	Rhode Island	Private recreational angler		Local waters use to be loaded with menhaden and now are completely void. Occasionally there will be peanuts in the LIS Sound estuary but very few an far between. Also lots of Dolphin and brown sharks probably looking for food. Ospreys further up Ct River hunting for food while the chicks are starving and die in the nest. All for the industrial fleets greed. Please stop this downward spiral. Thank you for taking this up
Ben DeMario	Rhode Island	For-hire vessel owner/operator/crew		All these studies and meetings is a waste of everyone's time and money. It's plan as day the numbers are WAY down. Shut the fishery down completely for a few years and watch what happens. Yes, people will lose jobs, but people jobs in the menhaden industry are not more important than the jobs that the menhaden support in other areas. Anyone who has a commercial interest in menhaden should not have any say in this because all they are thinking about is their bank account. They are not thinking about next years numbers of menhaden or the food source they are taking away from fish and animals. Shut it down, let it rebuild to record high numbers and then go from there.
Ben Bartoszuk	Rhode Island	Private recreational angler		Constant review of addendums impacting commercial and recreational fisheries is vital to maintaining meaningful conversation and understanding between the scientific and harvester communities.
Mary Alice Smith	Rhode Island	Concerned stakeholder		I support lowering menhaden's Chesapeake Bay cap to 50% of the current 51,000 metric ton fishing limit. I also support breaking the fishing season into three "quota" periods, so Osprey won't need to compete as much for food during the most vulnerable times of their life cycles. This gives the Commission the ability to plan and react to changing conditions. the Chesapeake Bay cap should be reviewed every 3 years.
Marc Grandmaison	Rhode Island	Private recreational angler		In all fairness, do what needs to be done to bring back the oceans bounty.
Seguin Spear	Rhode Island	Concerned stakeholder		It is essential for all stakeholders that we protect the continued population of menhaden through reducing harvest and stress on fish populations along the Atlantic.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Joshua Bartoszuk	Rhode Island	Private recreational angler		Menhaden are the base of one of the most diverse and plentiful food chains in the United States, providing economic and recreational value to millions across the eastern seaboard. Any inaction on the matter of harvest quota reduction should be considered as a deliberate attempt to continue to sabotage one of the most important ecosystems in the United States and the world.
Jackson Foster	Rhode Island	Private recreational angler		N.a
Michael Long	Rhode Island	Private recreational angler		No
David Prockop	Rhode Island	Private recreational angler		Now that we know how badly the menhaden population has been depleted, it would be irresponsible not to respond to this knowledge in ways that will allow the population to regrow. Reductions in allowable catch should be made immediately, and measured against catches in most recent years (not against previous quotas, which have not been reached because the population is already so badly depleted). If you act decisively to allow the menhaden population to regrow, it seems likely that will help support populations of other fish, such as striped bass. Protecting menhaden now might therefore allow striped bass to need less protection in the coming years. Thanks for soliciting these comments, which I hope and trust you will take seriously as you make these decisions.
Kevin case	Rhode Island	Private recreational angler		Ospreys nest failed this year in large numbers, obvious what's going on.
Scott	Rhode Island	Private recreational angler		Please limit ALL of the menhaden harvest including the entire East coast. Chesapeake and Narragansett bays.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James M Gilbane	Rhode Island	For-hire vessel owner/operator/crew		Stop commercial pogie dragging. Every fish eats them. I cast net bunker a single time this spring for my charter business for targeting striped bass.
Ethan Fuller	Rhode Island	Private recreational angler		Stop destroying our bunker stock and the fishery for foreign companies to profit.
Jason Protass	Rhode Island	Other (please specify)	Osprey conservationist	The decline of the fishery corresponds to the increased mortality of osprey. Dead young and juveniles are reported to have starved to death. Historical links suggest the cause is the status of the manhaden fishery.
Gigi D'Onofrio	Rhode Island	Private recreational angler		the full 50 percent Bay cap reduction, tied to the coastwide limit and split across three seasons under Option B2's 25/25/50 allocation, meaning the fewest menhaden would be removed during Osprey nesting season!
Chris mcintee	Rhode Island	For-hire vessel owner/operator/crew		There is a significant decline in menhaden in the waters I fish. It's currently October 8th and every harbor, bay and estuary should have schools of peanuts in plain view. There's none in our harbors, I see a few small schools throughout the bay in a day I run 50 miles in the boat. There's not been adult menhaden all year. We need to significantly reduce the harvest of menhaden
Hank DeWolf	Rhode Island	Other (please specify)	Osprey nest observer	We installed an Osprey nest in the marsh behind our property eight years ago since the first initial season, we have always had at least two fledglings leave the nest as adults. 2026 is the first year that we had no fledglings in our nest or any of the other nests in Barrington Rhode Island. Narragansett Bay lobster Tuna Buyer PT Judith all summer long and thus there was no forage for the ospreys to feed offspring had they had them. In addition, as an avid Fisherman, the lack of menhaden as forage for striped bass and bluefish caused Narragansett bay to be void of these species for most of the summer. The giant bluefin fishery is also a predator of the menhaden causing lower production this year.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert Westbury	South Carolina	Private recreational angler		Commercial harvest of Menhaden should be greatly reduced or eliminated in the USA. Find another source of protein, maybe lab grown?
Nicholas Armstrong	South Carolina	Concerned stakeholder		For the love of Christ, please…
Andrea Schechter	South Carolina	Concerned stakeholder		Please consider this thoughtfully to protect the osprey population.
Sandra	South Carolina	Other (please specify)	We use to boat on the Chesapeake Bay Area.	Should be reviewed yearly
Sherry A Oliveri	South Carolina	Private recreational angler		Thank you.
JEREMY FROST	South Carolina			The shortage of forage fish has had such a negative impact on all species it can not be tolerated and must be addressed!
Tom Cushman	South Carolina	For-hire vessel owner/operator/crew		This is a confusing and bullshit form . Stop taking the fuckjng menhaden you bought and paid for asshats
Janelle Musser	Tennessee	Concerned stakeholder		Follow science and protect wildlife and fisheries for future generations, not just those making money now.
Sue Denosowicz	Texas	Concerned stakeholder		The opinions of everyone concerned about fish must be considered, not only the opinions of fishermen or those in the fishing related industries.
Linda Gionti	Vermont	Other (please specify)		Citizen concerned about crashing Osprey populations.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Francis M. Sprinkel, Jr.	Virginia	Private recreational angler		"I support a 50% reduction in the bay cap and the use of quota periods."
Lesley Gamble	Virginia	Other (please specify)	Property owner on Gwynn's Island in the Bay	1. Reductions are only a step. Stop all industrial harvesting of menhaden in the chesapeake bay. The scale and methods are inappropriate, unsustainable and grossly wasteful (ie pollution and "bycatch"). Do not allow one large company from Canada, Cooke, to deploy industrial scale fishing to remove large quantities of a keystone species that supports a multitude of lives, human and more than human, and, as a result, a multitude of local businesses, not to mention families, towns and counties. 2. Food and economic security are primary and fundamental to a healthy democracy. Do I want to be dependent on a multinational corporation based god knows where for my food? Or do I want to be able to bait my own hook and catch fish in my own backyard? Failing that (I fail a lot!) pay a local charter to take me fishing or simply pay local watermen and women for my seafood? I vote for the later! I want the reciprocity, accountability and happiness of supporting my neighbors and our local community businesses. 3. The ugly snd toxic irony of eating farmed fish is not lost on me. I don't consume it anymore. It's supposedly taking pressure off wild fish stock but that's a lie. In fact, using menhaden to feed farmed fish steals from the wild fish, ospreys, local watermen and the entire ecology and economy of the bay. 4. Instead of incentivizing a rich multinational company's literal killing field for "making a killing" let's designate the Bay a sanctuary for menhaden regeneration so the bay's ecology, people and enterprises thrive and flourish right along with them. Thank you. With kind regards, Lesley
Brian Malsch	Virginia	Private recreational angler		50 percent reduction is a good start, overages in catch limits should be fined heavily.
Charles Machek	Virginia	Private recreational angler		A combination of the most restrictive measures needs to be passed! The Chesapeake Bay's food chain needs to be protected. Reduction fishing needs to be ended in the Chesapeake Bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Mary Broome	Virginia	Concerned stakeholder		A lower quota than proposed as an option would be desirable.
John cantrick	Virginia	Concerned stakeholder		A reduction is essential for the health of the marine life in the Chesapeake Bay!!!!!!
John Bush	Virginia	Private recreational angler		A revised cap is sorely needed to restore the health of the Bay. Omega and Ocean Harvesters have been overfishing the Bay for years and it is time to rein them in before further damage to the ecosystem occurs.
Mario Balitbit	Virginia	Concerned stakeholder		Adopting a more conservative approach to menhaden fisheries will increase the chances of other species, such as ospreys, recovering during turbulent times. Regardless of the outcome, Virginia and the Atlantic and Gulf coasts still need more science and conservation strategies moving forward.
Farrah B Sutton	Virginia	Other (please specify)	None	All fishing rules should apply upon next season opening for best estimates.
Bart	Virginia	Other (please specify)	Biologist, Fisherman	Allocate a percentage of bay quota to pound netters and bait fisherman.
Polk Kellam	Virginia	Private recreational angler		Appropriate conservation measures on menhaden harvest, especially in Chesapeake Bay, are long over due.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Lynne S. Haynie	Virginia	Concerned stakeholder		As a concerned citizen of Northumberland County, I strongly urge the Board not to consider any further cap reductions on the Chesapeake Bay menhaden fishery. From a biological standpoint: The ASMFC website reports that menhaden are not overfished. The Science Center for Marine Fisheries is completing research that will create a pathway for developing a scientifically sound and ecologically just harvest cap. Where is the logic in creating more restrictions on a healthy population before that research is complete? From a community standpoint: I am concerned about the economic impact resulting from any cut to the Bay harvest cap. A reduction in landings below the break-even point could force Omega Protein to close. In a rural community, with no comparable jobs, this would cause severe economic hardship for the many workers and their families whose lives have been tied to the menhaden fishing industry for generations. For those reasons, I ask that no further restrictions are imposed on the Chesapeake Bay menhaden fishery. Thank you.
Elizabeth Lipford	Virginia	Private recreational angler		As a forage fish, menhaden are the basis of the food chain that provide ecosystem benefits for fish , birds and all the way up to whales. The most protective measures should be deployed to provide the maximum amount of benefits for nature to thrive in the Chesapeake Bay and along the Atlantic coastline. Thank you for considering these protective measures.
Edmund Brodie III	Virginia	Private recreational angler		As a professional ecologist, it is clear to me that the massive erasure of a key resource at the base of the food web is having decimating effects on higher trophic levels. As a resident of the VA Bay region, I've watched stocks of aquatic predators (Striped Bass, Red Drum) and Osprey plummet to near zero in my local rivers over the last 5 years. The ecosystem cannot sustain the current level of harvest any longer

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Julie Ellis	Virginia	Private recreational angler		As a resident living on the Rappahannock River and a recreational angler who enjoys many days on the bay, I support the following: Section 3.1 Bay Cap Amount: Options C1e (reduces the Bay Cap by 50% and then links it to the Coastwide catch limit at a 13.6% proportion) AND option C2a (Upper Cap limit of 51,000mt and no lower limit) Section 3.2 Bay Cap Distribution: Options B2 (3 even length/uneven harvest quota periods 25%-25%-50%) AND Option B (establishes quota period overage and underage provisions) Section 3.3 Bay Cap Revisit Provision: Option B (revisit the Bay Cap every 3 years) Thank you for seeking feedback and fighting for the health of the Chesapeake Bay. Dr. Julie Ellis
James Hammond	Virginia	Private recreational angler		As a Virginia resident and lifelong recreational angler, I strongly support the 50% reduction in the Chesapeake Bay menhaden reduction fishery cap. I grew up fishing Virginia waters and believe protecting menhaden as a critical forage fish is essential to the long-term health of the Bay and species like striped bass. Given the concerns about localized depletion, I believe a precautionary approach is warranted rather than waiting until the damage is clear. Please adopt the 50% reduction.
Ryan Goodman	Virginia	Concerned stakeholder		At the current rate, the age of Menhaden is tracking younger, which doesn't bode well for the future of the industry nor the local ecology that depends on Menhaden for nutrients. Intervention is necessary because I want a sustainable harvest that supports communities and think in the long term. We need to cut the Bay Cap before it's too late.
Don	Virginia	Private recreational angler		Ban all Canadian owned companies from Chesapeake Bay. Require at least 3nm in the ocean only
William Klein	Virginia	For-hire vessel owner/operator/crew		ban reduction fishing

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kammie Lee	Virginia	Concerned stakeholder		Center for conservation biology published their 2026 Osprey report. Worst breeding year ever. 50% worse than DDT years. Menhaden are being overfished and will lead to the decimation of the Osprey population.
Lucile Miller	Virginia	Concerned stakeholder		Commercial catch of menhaden should no longer be allowed in Virginia waters due to the its negative impacts on game fish and birds, especially striped bass and osprey. These species require a dramatic recovery of menhaden to survive. It is time for decisive action.
Gorden Trutt	Virginia	Concerned stakeholder		Consider if you will this is not just a resource and object it is life itself
Luna Nordstrom	Virginia	Concerned stakeholder		Consider that Osprey are the "canary in the coal mine." I personally monitored 15 Osprey nests this year, with a combined group of 38 nests. Only 2 fledglings from my nests survived. The overall sustainability rate was .4 --and we believe that several survived because a person was actually supplementing the Osprey parents by putting fish on his pier (we don't support this, but desperate times...) Over and over I watched the adult Osprey dive and miss--until they would finally catch the smallest of fish. Osprey don't miss. They are efficient fishers. But they struggle with the tiny fish, and there aren't many large fish this year or the past two years. It has been devastating to watch nests fail through the season: Females not laying eggs; eggs failing because the female had to leave the nest to fish herself because the male wasn't able to catch anything; chicks failing because the female again had to fish; fledglings failing because the parents did not bring them enough to eat; and fledglings failing because they could not find enough fish. Every single young dead Osprey that we salvaged had starved. Our nest success rate is now lower than during the DDT years. I speak to several folks a week, on the Potomac River and along the Atlantic shore, that tell me the same news, that their nests are failing exactly the same. Osprey are NOT failing on the West coast. They are NOT failing in the Great Lakes area. Those Osprey thrive on other oily fish in those areas. They are doing just fine in Colorado, where they eat trout. This is an East coast failing, and it is directly related to a scarcity of what our East coast Osprey eat for their best nutrition--menhaden. Thank you.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Debbie	Virginia	Other (please specify)	Bay use for wildlife watching	Destruction of the Bay has resulted from over harvest of menhaden for decades.
DAVID B FRANCIS	Virginia	Private recreational angler		Do not allow menhaden harvesting inside the bay, period! Send them 3+ miles offshore, at least! Follow the rule ever other state has in place. Reduce quota by more than 50% for at least 3 years then revisit. Send the Omega boats offshore and away from the Bay.
Victoria Elsbernd	Virginia	Concerned stakeholder		Do the science - complete the studies first before making any decision to cut caps.
Bernard Berne	Virginia	Concerned stakeholder		Draft Addendum II, which will consider reducing the Chesapeake Bay reduction fishery cap by up to 50%, does not go far enough. The Chesapeake Bay fishery cap needs to be reduced by at least 80%. The present uses of menhaden benefit nobody except those who profit by catching and processing the fish and selling the finished product. None of the uses are actually necessary. In contrast, the fishery's adverse environmental impacts, which likely include declines in populations of other fish species, ospreys, bald eagles, and other parts of the food chain, are immense.
Jack gerstein	Virginia	Private recreational angler		E we need to do something before we loose it I've rec and commercial fished and it's not right out there
Gwen Gubeli	Virginia	Private recreational angler		Efforts to sustain this resource are greatly appreciated.
Diana Hutchens	Virginia	Private recreational angler		Eliminate Menhaden fishing completely like all other states! I was born and raised on the York River and have lived on a boat half time for past 32 years. There used to be fish to be caught but very few anymore, extremely sad. We travel up the bay several times each season and it is heart breaking to see them fish the Bay so broadly. When coming down the Bay this summer, when we crossed over the Potomac River we saw the Menhaden Fishing Trawlers fish right up the the Maryland line, it was digusting to see them push the envelop that we call our Chesapeake Bay!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kevin Lane	Virginia	Other (please specify)	Wildlife Rescue/Reha b	Every consideration should be given to protecting the menhaden and the wildlife in the Bay, in rescue and rehab we see every day how hard it is for wildlife, continuing to overfish menhaden in the bay will only make things worse.
Ronald Marino	Virginia	Private recreational angler		Fishing in the Bay is being destroyed by the current Menhaden harvest. All humans, birds and sealife that depends or counts on fishing opportunities in the bay are severly compromised due to Menhaden reduction harvesting.
Vance Hopkins	Virginia	Concerned stakeholder		Fishing tackle dealers have closed at an alarming rate for the past 10 years due to dwindling stock of consumer recreational fisheries. This has been mainly due to a lack of forage fish(menhaden)
Thomas P. Charlock	Virginia	Other (please specify)	Birder (osprey reproduction threatened by menhaden fishing)	For the interest of birding (osprey reproduction in Ches. Bay), please cut the amount of reduction fishing in the Ches. Bay; professional watermen transporting sport fishing have same interest.
Kathleen M Stewart	Virginia	Other (please specify)	Osprey advocate	For the protection of the Ospreys, it is most important to reduce the current cap by the highest amount and to spread the take period, with the highest concentration delayed until the Ospreys leave the Bay on their migration South in September.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
ann violi	Virginia	Other (please specify)	private citizen concerned with our environment with the goals of economic and physical sustainability.	Given the damage menhaden hauls have perpetrated, I would like to see a moratorium on any harvesting with a plan to compensate those workers who would be directly impacted- maybe switch to flax seed oil..Some inventive planning might suffice.
Alan Wingfield	Virginia	Concerned stakeholder		Given the emergency and dire condition of Osprey breeding in the main stem of the Bay, the balanced approach here is the most protective options provided. I would have preferred more stringent option, including an outright moratorium. But of the options given, the most protective represent a balance between ecological concerns and the interests of those involved in the reduction fishery.
Susan Laume	Virginia	Concerned stakeholder		Given the intense ecological warning signs present in the Bay for successive past years, with Osprey chick starvation, and Menhaden not moving to upper Bay reaches, with impact to other fisheries and industries, the most severe cut backs in reduction fishing should be adopted most quickly.
John Brooke	Virginia	Concerned stakeholder		Having abundant menhaden is critical for maintain osprey populations.
Lori Scheibe	Virginia	Private recreational angler		Hello- I grew up along the Potomac River when the river was very polluted and Bald Eagles were dying out. We came together and reduced river pollution and Bald Eagles are thriving now. We need to save the Osprey and everything else that relies on the Menhaden. Thank you for caring about our Food Web.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Michael Snow	Virginia	Private recreational angler		Honestly the Bay Cap is directly affecting our stripped bass population in the Chesapeake bay and we have not been monitoring this well at all. Also by reducing the cap now we will allow the population of menhaden to rebound and harvests could sustainably be higher in the future if populations return to what they were in 1990s. Please reduce the harvest and help our fishery for all parties involved.
Dale William Neal	Virginia	Concerned stakeholder		How does the caloric density and lipid content of Atlantic menhaden compare to other Chesapeake Bay forage species? Atlantic menhaden (Brevoortia tyrannus) function as the premier high-octane prey in the Chesapeake Bay, offering significantly higher lipid concentrations and caloric densities than nearly all competing estuarine forage species. While lean species like bay anchovy and spot deliver baseline protein, adult menhaden build immense fat reserves from direct planktonic grazing, making them nutritionally indispensable for large piscivores building energy for migration, overwintering, and egg production. - Chesapeake Bay Foundation Forage Species Typical Lipid Content (% wet weight) Caloric Density (kJ/g wet weight) Primary Nutritional Role in the Bay Atlantic Menhaden (Age 1+ / Adult) 8% – 18%+ (peaks in late fall) 6.5 – 9.0+ kJ/g High-energy fat packets; critical for adult striped bass, cobia, and osprey. Atlantic Menhaden (Age 0 / Peanut bunker) 3% – 7% 4.5 – 6.0 kJ/g Transitional energy source for juvenile predators and diving birds. River Herring (Alewife / Blueback) 6% – 12% 5.5 – 7.5 kJ/g High-lipid spring forage, but temporally and spatially limited by spawning runs. Bay Anchovy 2% – 5% 3.8 – 4.8 kJ/g High-volume, low-fat protein base fueling young-of-the-year predators. Atlantic Silverside 2% – 4% 4.0 – 5.0 kJ/g Lean inshore forage for juvenile gamefish and marsh-dwelling predators. Spot (Juvenile) 2% – 5% 4.2 – 5.2 kJ/g Protein-dense benthic prey; low energy per gram compared to pelagic clupeids. Mummichog / Killifish 1.5% – 4% 3.5 – 4.5 kJ/g Low-lipid, lean estuarine forage relied upon in marsh shallows.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Brandon Maddox	Virginia	Private recreational angler		I am 45 years old and have fished the rivers and the bay my whole life. I have never seen so few schools of fish as i have the past 10 years. Each year gets worse and worse. If nothing is done we will see a collapse of the bays ecosystems within my life time. I love to catch and eat fish, nowadays its more of a boat ride than a fishing trip. 50 percent reduction is not enough, close it until a fully independent multi year study can be completed. If we were talking about any other species of fish the season would have been closed years ago ie herring, shad, ect.
Forrest Spaits	Virginia	Shore-side support industry (e.g., bait and tackle shop owner, boat retailer)		I am a fishmonger in Virginia and have begun working more in depth with our local seafood institutions, alongside the fishermen and farmers who make this industry possible. Omega Protein is extremely unpopular, and we want them OUT OF OUR WATERS. We can acknowledge that this is a nice step in the overall fight for menhaden, but this is not enough. We must ban foreign corporations from destroying our ecosystems and support our watermen at home. Thank you.
Robert Walker	Virginia	Commercial harvester or dealer		I am a resident of Reedville Virginia and work for ocean harvesters. I strongly vote option A no change to the bay quota.
Janet Gohres	Virginia	Other (please specify)	Birdwatcher, conservationist, recreational fisherwoman	I am againt allowing reduction fishing of menhaden in Chesapeake Bay. It is depleting fisheries on up the Atlantic Coast and starving wildlife as far north as Maine.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Virginia Wycoff	Virginia	Concerned stakeholder		I am an avid birder currently living in the Commonwealth of Virginia. I previously lived in Florida and had many opportunities to observe Osprey in all of their splendor. The impact of menhaden overfishing has decimated the Osprey population and needs to be curtailed to restore the area as a viable Osprey breeding ground. I appreciate the opportunity to comment on this draft addendum and am hopeful that changes will be made to reinvigorate the Osprey population. Ignoring the impact on the Osprey population caused by menhaden overfishing is unconscionable. The changes for which I have expressed support are an imperative first step to begin to remedy the devastating impact of the current state of menhaden fishing in this region. I implore you to make the changes for which I have expressed support.
Arthur R. Wycoff	Virginia	Concerned stakeholder		I am an avid wildlife photographer currently living in the Commonwealth of Virginia. I previously lived in Florida and had many opportunities to photograph and observe majestic Osprey. Unfortunately, the impact of menhaden overfishing has decimated the Osprey population and needs to be curtailed to restore the area as a viable Osprey breeding ground. I appreciate the opportunity to comment on this draft addendum and am hopeful that changes will be made to reinvigorate the Osprey population and ensure the health of the ecosystem. Such action would also prevent the menhaden population from plummeting, which would destroy the livelihood of many people. Ignoring the impact on the Osprey population caused by menhaden overfishing is unconscionable. The changes for which I have expressed support are an imperative first step to begin to remedy the devastating impact of the current state of menhaden fishing in this region. I respectfully request you to make the changes for which I have expressed support.
Michael Lipford	Virginia	Private recreational angler		I am concerned about the decline in living resources of the Chesapeake Bay that are dependent on a healthy forage fish population. Specifically seabirds like osprey, terns and shorebirds as well as recreational fish like striped bass. These concerns extend to the Atlantic coast as well. It is time to responsibly limit menhaden harvest and monitor the effectiveness of those measures on a regular basis.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Christine Brown	Virginia	Concerned stakeholder		I am most invested in the health and welfare of the raptors that feed on the fish and will defer to scientific research.
David L Rosmer	Virginia	Other (please specify)	Boat owner and recreational fisherman and environmentalist	I am not against the menhaden fisheries but over fishing harms all and, if allowed to continue, will force it to end at some point in the future.
Barbara Slatcher	Virginia	Other (please specify)	I was an surf fisher in VA and NC, now bird watcher	I am sending my comments separately

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Tom Burkett, Seasider Charters LLC	Virginia	For-hire vessel owner/operator/crew		I am the owner and captain of Seasider Charters LLC. We operate ecotours in both the lower portion of the Chesapeake Bay and the Seaside of the Eastern Shore of Virginia. Our charter business is one of many in this coastal region that depends on a healthy, properly managed fishery. The coastal region of Northampton County where my business operates remains the hardest-hit area by the menhaden reduction fishery. Net-set data show that more menhaden reduction nets are set in Northampton County than in any other county on the Eastern Seaboard. The Northampton County Board of Supervisors recognized the inequity and the socioeconomic strain the menhaden reduction industry places on our region of the Chesapeake Bay and local businesses. For this reason, the Northampton County Board of Supervisors unanimously approved an Industrial Menhaden Moratorium Resolution. The resolution came after years of county concerns regarding the health of the menhaden stock, record low striped bass and osprey recruitment numbers in the Chesapeake Bay, and public health and economic issues caused by the industry's persistent fish spills and concentrated extraction in the lower Chesapeake Bay region. The resolution remarks that the ASMFC and the Atlantic Menhaden Technical Committee can not provide Northampton County scientific assurance that the spatial or seasonal stock of menhaden in the Chesapeake Bay is healthy, or quantify the ecological and socioeconomic impact of localized depletion due to concentrated industrialized Atlantic menhaden fishing techniques in the Chesapeake Bay. The ASMFC should take the most conservation minded reforms available at this point in time until scientific assurance can be provided. I call on the ASMFC to approve the most conservation-minded reforms that better protect menhaden and support a healthy Chesapeake Bay ecosystem and the businesses that depend on a healthy ecosystem, including reducing the Bay Cap by 50 percent in 2027 and implementing quota periods to more effectively distribute reduction fishing pressure throughout the season. Support these conservation-minded reforms. Local businesses like mine are depending on you to take action and properly manage our fishery. Thank you, Captain Tom Burkett Seasider Charters LLC Northampton County Virginia

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Stacie D. Hendrickson	Virginia	Concerned stakeholder		I am writing in support of Omega Protein and Ocean Harvester ("Omega"). Keep the cap the same or raise it. This is not just about menhaden, this is also about people. Prior to retiring to the county Omega operates, I was a corporate Chief Operations Officer and I know your decision to further reduce the cap will economically crush this community. Further caping Omega's catch limit will be a case study in what not to do with regulatory authority and you will own the results of your actions. Omega created Reedville and has been a staple in our county for nearly 150 years. It is our county's single largest employer and its impact reaches far beyond people who receive a paycheck. Omega creates $100 million in economic activity for the state of Virginia and is a supplier to the largest food production companies in the country. Omega is a national treasure, a historical landmark, and a source of pride. Omega has long term commitments and investments in this region. This region, in return, has made generational commitments to the fishing industry. Their continuing operations is the return on investment. Omega employs over 250 people and twice as many indirectly. They provide $29 million a year in payroll and benefits to our friends and neighbors. This money doesn't disappear into a corporate balance sheet. It goes home with local families. It is spent on our homes, at our grocery stores, restaurants, gas stations, and other local businesses. Additionally, Omega sources all of its business supplies and services locally which, in turn, supports other businesses and families. You are wrong to take these jobs, these families, and our economic future for granted. Omega takes its role in my community seriously - it means something to them. It should mean something to you as well. Your own data shows the menhaden population is healthy and thriving, yet you want to reduce catch limits again. This will create an unsurvivable economic ripple effect across this region, while not providing any environmental solutions. Your decision to reduce their limits is a lose - lose proposition. Omega has addressed your issues, they have yielded, they have compromised, and they have adapted to new regulations again and again. Let's find a way to allow our community to thrive while also protecting the Bay. The two have coexisted for nearly 150 years. Omega has been part of Northumberland County for generations so let's make sure it remains part of our future.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James Deaver	Virginia	Private recreational angler		I believe restrictions should be put in place now and see if the fisheries improve. If little or no restrictions are increased and the fisheries do not improve or get worse, you have kicked the can down the road and missed an opportunity to do something before it's to late.
Jimmy Harris	Virginia	Concerned stakeholder		I believe that the bay is over fished for this important resource. Sorry that Reedville and Omega Protein is protesting this initiative. Its part of being in a business for profit, and adapting to change. The greater good should be for the bay. I was born and raised in Virginia and spent a lot of time on the bay.
Sarah Mayhew	Virginia	Concerned stakeholder		I believe the Council must balance the needs of the fishery to remain viable with the long-term harm to the Chesapeake Bay ecosystem. At this point, it appears the Chesapeake Bay has been seriously harmed. The reduced harvests should remain in effect until an adequate scientific study of the age categories and abundance of menhaden in the Chesapeake Bay has been completed. Relying on historical data is not going to maintain a viable fishery in the future. We need the new data.
Tyler Nonn	Virginia	For-hire vessel owner/operator/crew		I depend on bunker nearly every day in my charter business we run hundreds of trips a year with multiple boats, providing multiple jobs in a small town. Many of our guests stay at local hotels and VRBO's and eat at local restaurants.
Mary Kane	Virginia	Other (please specify)	environmentalist	I feel there must be controls on overfishing

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Mark Headly	Virginia	Private recreational angler		I have fished Chesapeake Bay since 1977. I have had my own boat since 2001 and fished between 5 and 20 times per year on the Bay. I really would rather VA followed Maryland's lead and banned netting in the Bay, but since that is highly unlikely, I would prefer the options noted above. The Bay has always been exploited by both recreational and commercial fishermen, but the technology and capabilities of 2026 are orders of magnitude more effective at removing menhaden than the methods available 150 years ago when Reedville claimed its place in fishing history. I fish mostly out of Smith Point and it is evident to me when we head south into VA waters and see the Reedville menhaden fleet and their spotter planes that they are taking a significant chunk of the menhaden in VA waters just based on the equipment and effort expended.
Samuel Gaddy	Virginia	Private recreational angler		I have fished in the Chesapeake Bay for 65 years. During the moratorium on rockfish, the boom years after the moratorium was lifted and now it's not worth going for rockfish as there are so few. I know there has been overfishing but now there is nothing for them to eat as the menhaden are being sucked up in factory ships. We would regularly see menhaden being 12" or larger now 5-6" is the norm. I live is Deltaville,VA and our bay used to have 14 active osprey nest now there are 3. There is nothing for them to eat either. I beg the commission to take action to reduce the menhaden quota but I would really wish Omaga would be banned from catching the fish in the Bay.
Gary Tingley	Virginia	Private recreational angler		I have kept my boat on Sara's creek, Gloucester Point since 2004. In addition to the drastic reduction of Rockfish population, the three Osprey nests in the channel did not produce any chicks for the first time in 22 years. No available Menhaden!
Ed Knight	Virginia	Private recreational angler		I have lived at the mouth of the York River and the Chesapeake Bay for the past 15 years. I have experienced a steady decline in the menhaden population as evidenced by the lack of Gannets in late fall that follow the schools of menhaden in the water.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Andrea Levine	Virginia	Other (please specify)	Recreational angler, Master Naturalist, Wildlife observer	I have lived on the Bay since 2008, am an avid responsible angler, bird watcher, and a Master Naturalist since 2023. In recent years I have witnessed a marked decline in our Striped Bass population as well as numerous failed Osprey nests. The quota questions being proposed here are not addressing the real concerns of overfishing in the Bay. Unbiased scientific research and data must be presented in a timely manner in order to present the facts. Asking the general public to choose quotas is biased and irresponsible. In the meantime, why is it that Virginia is the only state still allowing Menhaden fishing in the Bay? My vote would be for a total ban in the Bay until we have real data before the damage becomes irreversible.
Wayne Johnson	Virginia	Private recreational angler		I have owned property on a creek that feeds into the Bay for 20 years. There are many charter fishing captains who are canceling trips because the Bay can no longer support charter fishing. Menhaden reduction fishing is one cause that can be immediately corrected with these changes. I appreciate your support.
Kenneth Hil	Virginia	Private recreational angler		I have personally witnessed the decline of menhaden in the bay and the negative impact on dependent species. We need to reduce the catch in the bay substantially.
Christine H Llewellyn	Virginia	Concerned stakeholder		I have seen an increasing number of starving osprey come into wildlife rehabilitation care over the last few years. We have to give them a fighting chance at survival by not removing their food source.
Bill Hafker	Virginia	Private recreational angler		I have seen for myself the damage being done to an entire ecosystem, one of the greatest estuarian ecosystems in the world, for the profit of a single company, whose products all can be found/made in other ways. This is an unconscionable behavior, and one that will be looked back on with disdain if those responsible for its control, allow it to continue unchecked, until the fishery collapses under Omega's own greed and the fish are gone not only in sufficient numbers for the rockfish and ospreys and other that rely on them, but for the owners of Omega.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Tom Dolan	Virginia	Private recreational angler		I have witnessed the Bay fishing becoming worse every year for the last 20 years. The trophy Striper season has become nonexistent. I have also witnessed the excessive harvesting of these bait fish. They are the life of the food chain in the bay and this cannot continue.
Karen Pica	Virginia	Concerned stakeholder		I hold a PhD and have been following the research. There is no scientific study that supports reductions that is peer reviewed and replicable. There is no scientific study that identifies the optimum osprey population in order to say it is being decimated. There are scientific studies identifying how the current harvesting is not harming the marinelife and it is being ignored. Decisions regarding this life-sustaining decision cannot be made on emotion only. Follow the science as it shows there is no scientific rationale for further reductions in the menhaden harvesting.
Alfred Ellis	Virginia	Private recreational angler		i honestly dont think omega/industrial reduction should be fishing in the bay at all. Its an animal nursery and should be a national park frankly
David Helms	Virginia	Private recreational angler		I live on the Mobjack Bay in the lower Chesapeake Bay. Bunker fish were once abundant especially as the year progressed and almost every Osprey nest along the Ware River were successful in raising a pair of chicks. Now, few schools of bunker are observed, Osprey chicks are starving and dolphin pods rarely appear in the river. While coast-wide trawl surveys may indicate the Menhaden Fishery is stable, this is NOT the case in the lower Chesapeake Bay.
Steven Guilday	Virginia	Private recreational angler		I politely urge you to take action to protect the bay and it's important "foundation fish". Virginia is the only mid Atlantic state who permits this public resource to be decimated as they do. And to what end? The protection of a few jobs. This backwards thinking impacts us all…detrimentally to be clear. It is time to wake up - I am on the bay 2-3 days a week, and while my feedback is anecdotal and not scientific, I am also in the right.
Angela Woodward	Virginia	Other (please specify)	Concerned citizen	I pray we can make a change!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Lilia Komleva	Virginia	Concerned stakeholder		I selected the options above that would allow the least amount of fishing, but my actual preference is for no fishing at all, both to protect the menhaden and for the reasons stated above. The Commission should consider the interests of all residents, not just those who fish.
Jennifer R Salan	Virginia	Concerned stakeholder		I selected the options for "least" fishing but in actuality, I'd like NO fishing of this species because it is a vital part of the Chesapeake Bay habitat. Already we're witnessing declining fish populations because the Menhaden is in decline. We don't need to allow the fishing of Menhaden for fish oil or fertilizer - we need them to get back to solid numbers to keep the rest of our fish safe and healthly.
Ruth Amundsen	Virginia	Other (please specify)	waterfront resident, boater	I still think the book "The Most Important Fish in the Sea", although old, is illustrative of why we need to limit menhaden catch, for the overall health of the Bay, general commercial catch and sport fish populations, and ospreys specifically. I think allowing a non-US-owned, non-local company to make a huge profit by stripping our Bay of a valuable asset is unconscionable.
Scott Graves	Virginia	For-hire vessel owner/operator/crew		I strongly support a 50% reduction in the Chesapeake Bay menhaden harvest cap. Menhaden are a critical forage fish supporting striped bass, bluefish, osprey, eagles, and the broader Bay ecosystem. Meeting coastwide population targets does not guarantee adequate forage in the places predators need it most. Concentrated industrial harvesting is depleting this essential food source in the most vital feeding and nursery area. We should act before ecological damage becomes irreversible. I urge the Commission to adopt the full 50% reduction and prioritize the long-term health of the Bay, its wildlife, and future recreational fishing opportunities over short-term industrial harvest interests.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Patricia Quinn	Virginia	Other (please specify)	Birder concerned about severely declining Osprey population	I strongly support the Osprey population in the Chesapeake Bay.
Letitia Johnson	Virginia	Concerned stakeholder		I support and stand with CBF in supporting these strong conservation-minded reforms

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Daniel E Davis	Virginia	Private recreational angler		Fishery Cap and spreads remaining harvest later in the season. Status quo is not precaution. It is continued industrial extraction from the last East Coast reduction fishery in a nursery estuary while ospreys fail and striped bass remain overfished. 1. Ospreys and striped bass are already paying the cost of the current cap. Peer-reviewed research from William & Mary's Center for Conservation Biology, USGS, and partners found widespread osprey reproductive failure in high-salinity Chesapeake waters, where the birds depend most on menhaden. The authors conclude that reduced Atlantic menhaden availability is a primary driver of poor reproduction. Menhaden deliveries to nests have fallen sharply over decades; diet energy content has dropped; chicks starve. Recent field results are worse still: productivity in saltier waters fell to about 0.25 young per pair in 2026, far below replacement, with a projected rapid decline if conditions do not change. ASMFC's own ecological reference points treat striped bass as the most sensitive modeled predator. Striped bass are overfished. The 2025 assessments lowered the ecological reference points and supported leaving more menhaden in the water. A 20 percent coastwide TAC cut does not fix concentrated purse-seine harvest inside the Bay during the weeks when ospreys are provisioning chicks and when Maryland bait fishermen need fish moving up the estuary. The addendum itself notes concentrated mid-summer reduction landings and a sharp drop in Maryland pound-net harvest. That is exactly the pattern three quota periods are meant to interrupt. 2. This fishery exists to serve one industrial complex. Virginia is the last Atlantic state that still allows industrial reduction fishing in state waters. Ocean Harvesters takes the Bay reduction harvest and supplies Omega Protein's Reedville plant. The 51,000 mt Bay Cap is not a Bay biological reference point. It is a historical-landings number that reserves a public forage base for one reduction operation. Other states ended this practice. Maryland watermen and the Bay's predators should not have to absorb the residual risk so that one mid-Atlantic processing system can keep an annual industrial allocation. 3. The data gap is real. That is why the burden of proof belongs with those who want to keep the 51,000 mt cap. Draft Addendum II is honest about what it does not know. There are not sufficient scientific data to fully describe Bay abundance, movement, and the effect of fishing. The

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Terri Cuthriell	Virginia	Concerned stakeholder		I support reduced harvest so that ospreys, marine birds, and native fish can rebound. Also, I support reduced harvest because more menhaden in the Bay provides more Bay filtering. Thank you
Luke Lemon	Virginia	Private recreational angler		I support the following selections
Gregg Shivers, MD	Virginia	Concerned stakeholder		I support the Manhaden fishery remaining a sustainable and viable industry for the Northern Neck of Virginia. At the same time, there is ample evidence that there is a decline in nesting pairs of Osprey and successful broods (an indicator species). A recent study by the Eastern Ecological Center points to a decline in manhaden stock as a prime cause of the documented decline in Osprey numbers. What appears to be missing is scientific data on the population of Manhaden and making a confident link between overfishing in the Chesapeake estuary and the environmental impact. I am hopeful that the VIMS research funded through the state will help to clarify what bay cap will lead to a sustainable fishery both economically and environmentally.
Tim Morgan	Virginia	Private recreational angler		I sympathise with the commercial fishing interests but it is important to address the obvious deficit of menhaden in the bay. So the fundamental change needed now, until we have better science, is to push the fishery out of the bay to the ocean.
Kathryn P Miles	Virginia	Other (please specify)	Live on the bay	I understand that commercial fishing has a life component of supporting the families that work there, but I feel big business is taking advantage of our fragile ecosystem and do not want an important part of that ecosystem driven to extinction for business and greed. Many other businesses rely on this fragile ecosystem. When we moved here to the lower bay I was excited to watch an osprey nest from my backyard. After our first year here it has never been active again. Our neighborhood nests have gone downhill. It is heartbreaking to watch the adult ospreys soar over the bay and dive, with nothing in their talons when they rise. They are an important part of our ecosystem and they must have access to menhaden. I am against allowing OMEGA their current seemingly free rein to over fish our menhaden. PLEASE ACT

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Victor Luftig	Virginia	Other (please specify)	Tourist	I visit the region from the Charlottesville area with my family at least once per year, and the ospreys are an essential reason for those visits. We have spent money in Reedsville and the surrounding towns. I think the Commonwealth should be providing support for the fishing industry to offset losses that would be the result of reduced fishing of menhaden, but I think such reductions are imperative.
Tomoko Hamada	Virginia	Other (please specify)	Bay front Property owner,Master Naturalist, and founding member of Osprey Watch Alliance	I would like to have total moratorium for three years but this is not the option gI can have,so I support this addendum B4 for 50percent reduction
Leah Shepherd	Virginia	Private recreational angler		I would like to see a moratorium in the Bay for 3 years or until the game fish and Ospreys come back in numbers similar to 2015.
Thad Konopnicki	Virginia	Concerned stakeholder		I would prefer a total elimination of the menhaden harvest in the bay and its tributaries. Harvest in the ocean line every other state. You are killing our osprey and striped bass.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Rossie V. Baker, Jr.	Virginia	Private recreational angler		I've lived in Hampton Roads my entire life and have fished the lower Chesapeake Bay for a good 40 years. I have never seen fewer and smaller schools of menhaden than I have in 2026. The Reduction fishery has decimated that baitfish population and the State of Virginia has never successfully limited the catch. Twenty years ago, we arguably had the best striped bass fishery on the east coast. Now, it's just gone. There's a good fishery near the Maryland state line, because they (Maryland) kicked Omega Protein out. But Virginia just can't seem to take that step. Politicians on Omega's payroll is the going theory and there's no evidence to dispute that theory. Please do something. A 50% reduction to the bay cap would be a great place to start.
Tim Hatok	Virginia	Private recreational angler		I've watched the amount and quality of sport fish decline over the 26 years I've been fishing in the bay. I've also noticed a massive reduction in schools of menhaden each summer. These have to be linked. The destruction these menhaden cause while actively fishing can't be understated. Every time I see them the amount of dead bunker too small for the nets, the filthy sludge that comes off of the boats, and the dead by watch like turtles, rays, red drum is appalling.
Molly Rae Pearl	Virginia	Concerned stakeholder		I'm concerned about the declining Osprey population and am voting accordingly

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Roberta Kellam	Virginia	Other (please specify)	birding and ecotourism	discuss the Atlantic Menhaden. There were two important points made at this summit (see page 34): (1) There was an ongoing concern of the decade-long decline in recruitment in Chesapeake Bay. (IN 2004!) (2) Menhaden have diminished compared to its historical abundance in the Chesapeake Bay. (Again, this decline is noted in 2004 – we are now in 2026!) In 2004, significant concerns were raised about the historical decline of Atlantic Menhaden in the Chesapeake Bay. After 22 years of inaction, ASMFC is now poised to finally reduce the Bay quota to a level that might allow restoration of the species, although it might already be too late. We don't know if it is too late because ASMFC never directed the studies to be done on the Bay after the 2004 Summit. Shame on ASMFC. Important issues were addressed in the 2004 Summit – some of which led to attempts to develop an ecological reference point, and some which were significantly delayed by the Menhaden Reduction Industry's political influence (i.e., a Chesapeake Bay study). Please note the following: Page 11: "The importance of menhaden to osprey, loon, and brown pelican can be assessed in quantitative terms. Birds should be used as a bioindicator." Page 13: "There has been a negative trend in recruitment to age 0 over the last 20 years. Age 0 and 1 are not fully selected by the fishery. Age 1 shows a declining trend in recruitment as estimated by the model for age 0 and age 1……The latest assessment shows that Atlantic menhaden are not overfished and overfishing is not occurring. The model does not address localized depletion in areas such as the Chesapeake Bay." Page 19: Effects of Concentrated Harvest in the Chesapeake Bay, Historical and current removals from the Bay (Doug Vaughan, NOAA Fisheries) "Chesapeake Bay is the center of the species range for Atlantic menhaden (Brevoortia tyrannus). Menhaden form large near surface schools and are obligate filter feeders. They are an important pathway from the primary producers to higher-level piscivores. Menhaden spawn offshore and the larvae are transported into the estuaries. Juveniles reside in estuaries during their first year of life. Juveniles migrate from estuaries to the ocean in late fall. The migratory pattern from tagging demonstrates one population that moves north in spring and stratifies by age and size along the coast in summer. Larger fish of similar age move farther north. In Chesapeake Bay, ages 1-3 predominate. In the Mid-

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Tanya O'Connor	Virginia	Other (please specify)	Recreational boater; human who cares about the planet and other species, particularly their wellbeing in the Chesapeake Bay.	In order for a fishery to be properly managed and any change to be meaningful, there MUST be independent oversight, separate from relying on data Omega provides!
Miles Townes	Virginia	Private recreational angler		In question 11, the Revisit Provision should be modified to include “or sooner as may become necessary by changed conditions.”
Betsy Washington	Virginia	Concerned stakeholder		In view of the critical role of the Chesapeake Bay as a primary nursery area for Menhaden young of year and the findings that 2026 is the worst year ever recorded for predators of Bay menhaden populations including Osprey, strong measures are a must to protect and rebuild breeding and young of the year populations and protect the Bay ecosystem. As a former Fishery Biologist that worked with Larval and juvenile fish populations the management policy needs to do everything possible to protect the juvenile populations and early age populations in the Bay.
Lee Ceperich	Virginia	Concerned stakeholder		Industrial fishing should be restricted to three miles offshore. No industrial fishing should occur in the Chesapeake Bay or Rappahannock River or any estuary.
Paul Anderson	Virginia	Private recreational angler		It appears that the ecosystem in the bay, including breeding ospreys, is dependent on an abundance of Menhaden. I am in favor of all actions and restrictions that will increase and protect the menhaden population in the bay and adjacent coastal waters

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Dennis Parmenter	Virginia	Private recreational angler		It appears that the past over harvesting has had an adverse impact on the overall health of the bay. The water quality has diminished significantly since remaining filter fish are insufficient to maintain water quality Therefore increasing the red tides and dead zones.
jean nelson	Virginia	Other (please specify)	bay resident	it has been verified that ASMC made damaging stock assessment mistakes on two fronts five years ago. ASMfc staff acknowledged their miscalculation and determined that a 50 to 54% reduction in bay cap is necessary to correct their serious error. this tracks with Asmfc's own reporting that states that landings since 2021 are the lowest in 80 years. omega is not in business to leave fish behind, but they have shortened fallen significantly short of their tac during this same timeframe proving that they have devastated the bay stock for at least five years. A 50% reduction is what was recommended by your own experts. The large number only reflects the magnitude of the damage that has already been done. Omega will fish themselves out of business if allowed to - save them, save the bay, while theres something left to save. your five years into a serious miscalculation and that 50% number will grow exponentially larger every year you delay already five years into this mistake miscalculation what they failed to put this place
Paul Hartman	Virginia	Private recreational angler		It is a crime that commercial fishing is destroying the sport fish in the Atlantic and companies are getting rich stealing fish from the American sportsmen!
Richard Parker	Virginia	Concerned stakeholder		It is a shame that our state has allowed the overharvest of menhaden in the Chesapeake for so long. It's hard to not think it was political. We should all be ashamed of ourselves for allowing this overharvesting to go on so long. The Osprey cannot reproduce enough to sustain their population, and it is a sad thing to see starved chicks that Osprey pairs could not feed due to no menhaden. If the Osprey population collapses forever, we have only greed to blame, and we should be ashamed of ourselves as a civilization to have been such poor stewards of our planet. The fishing recreation industry is collapsing also, and that will hurt Virginia in many different ways.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Theodore Hoffmann	Virginia	Private recreational angler		It is absolutely critical to reduce the quota in the Chesapeake Bay to provide food for game fish like striped bass and for osprey.
Joette Borzik	Virginia	Other (please specify)	certified VA Ecotour Guide and local resident	It is hard to imagine that we as Americans would not want to protect our keystone species like the Osprey. I believe we should halt all catch of menhaden in the Chesapeake, like Maryland and other states has done. Obviously this is not an option, but I asked in the questions above for the strictest regulation on menhaden harvesting.
David Shantz	Virginia	Concerned stakeholder		It is past time to implement reasonable, *science based* quotas to the indiscriminate harvesting in the Bay that has been allowed up to now. The Menhaden Reduction Industry has leveraged their political power for too long, and their actions and harvest totals pose a continuing, and compounding threat to not only the Menhaden fisheries, but the entire ecosystem of the Bay. Please follow the best science based guidance to regulate this harvest as has been intended. Do not cave to political pressure that continues to have long term negative impacts, not only to the Bay, but to the widely varied economic interests in a healthy Chesapeake Bay.
Perry Mastrola	Virginia	Private recreational angler		It is ridiculous that any of this type of commercial fishing is done in the bay while we are trying to keep it clean and healthy. I am paying for recreational fishing licenses for all of my boats and the fishing is not that good since these commercial boats are cleaning out everything
Teig F Shaw	Virginia	For-hire vessel owner/operator/crew		It is well past time to stop kicking the can down the road. It is time to manage the resource for all concerned and NOT just Ocean Harvesters and Omega/Reedville. As H Bruce Franklin wrote: "The Most Important Fish in the Sea" Time to treat it as such.
Betsy Saunders	Virginia	Other (please specify)	Concerned citizen	Its past time to put the health of the Bay above corporate profit.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Mark Mullen	Virginia	Private recreational angler		I've been fishing the bay several times a month from march to December for over 20 years now and the number of menhaden that I come across has drastically decreased to a fraction of what it was. lets reduce the quota by 50% and keep studying them and their impact and readjust as necessary
Jon DeHart	Virginia	Private recreational angler		I've been fishing the Chesapeake Bay for 40+ years and have noticed a drastic decrease in Atlantic Menhaden, especially the last 10 years. The fact of the matter is that I've moved to fishing in Maryland waters primarily because of it. And there is an astronomical difference in the amount of Atlantic menhaden in the Maryland stem of fhe Chesapeake bay. I mainly attribute to menhaden boats from Reedville, VA not being allowed to fish Maryland waters. For this reason, we need our resources to be left alone to rebuild themselves so we can have a fishery for the next generations to enjoy. If this isn't taken care of this year, it's probably too late.
Patricia Massari	Virginia			I've selected these options for the least fishing but in actuality want no fishing. The Commission should consider the interests of all and not solely those who fish. As well, Menhaden are fish who serve as food for other animals ranging from birds to whales. Some of these species are showing population declines believed to be caused by a decrease in menhadens. The Chesapeake Bay serves as a nursery for many of these animals. Virginia is the sole East Coast state that allows these fishes to be caught for reduction fishing and that is upsetting. Thank you for your consideration.
Judy Guariglia	Virginia	Concerned stakeholder		Keep it as strict as possible since it's a critical key stone species. It's not just for us but everyone in the water, by the water and on the side of the water. Let nature heal so that we can enjoy more of the bounties for us and for generations to come.
Jason Lewis	Virginia	Commercial harvester or dealer		Leave the quota alone. No science saying to do anything other then leave it alone.
Mark Carstens	Virginia	Private recreational angler		Limit harvests to outside the bay and outside three miles of the coast. Implementing these restrictions would improve the bay and the fishing associated with the bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Thomas Faisant	Virginia	Private recreational angler		Limit the Omega Company to only go out 5 miles or more into ocean.
Peter Dezendorf	Virginia	Other (please specify)	I am witnessing the decrease in the survival of osprey chicks.	Limiting the measurable impact of menhaden harvesting by the status of other fish ignores a serious problem with birds. Osprey numbers are falling as chicks starve due to the parents unable to catch enough menhaden. I recommend starting menhaden harvesting after osprey fledging occurs.
Baxter Beamer	Virginia	Concerned stakeholder		Menhaden are a critical natural resource in the Chesapeake Bay. Warning signs such as dramatic Osprey declines must be heeded, and the reduction fishery should be held to account for its role in regulating healthy menhaden populations.
Meredeth Dash	Virginia	Concerned stakeholder		Menhaden are the most important and beautiful fish in the Bay. They are a keystone species that are at the base of the food chain for so many other Bay critters. Please do everything in your power to maintain our menhaden populations in the Bay.
Robert Allen	Virginia	Private recreational angler		Menhaden are very important to the overall health of the bay and coastal fisheries. We need responsible management of Menhaden.
Tom Fenn	Virginia	Private recreational angler		Menhaden are vital to the fall migration of striped bass into the Chesapeake Bay and represent a fishery with substantial economic impact which has not been included in the analysis. For this reason, splitting quota period 1 underage between periods 2 and 3 is important.
Matthew Lee	Virginia	Private recreational angler		Menhaden fishery should be pushed out of the bay totally to let the stock recover. I have commercial fished and recreationally fished all my life and have seen the devastating affects of over fishing of the Menhaden stock.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Rick Meinke	Virginia	Private recreational angler		Menhaden fishing should be limited to coastal fishing only. Menhaden enter the bay for a reason. Osprey and stripers follow the food source. We don't need another 10 year study to come to a decision on overharvesting, etc. The decline of fish species can't wait, while "scientists" dilly dally around with figures for years to come. The menhaden numbers are up, put Omega out in the ocean.
Christine Lofgren	Virginia	Concerned stakeholder		Menhaden serve as food for other animals ranging from birds to whales. Some of these species are showing population declines believed to be caused by a decrease in menhadens. The Chesapeake Bay serves as a nursery for many of these animals. Virginia is the sole East Coast state that allows these fishes to be caught for such uses as fish oil or fertilizer ("reduction fishing"). I selected the options for the least fishing, but would prefer no fishing, for the sake of the menhadens and for the reasons mentioned above. As a Virginia resident, I also ask that the Commission consider the interests of all and not solely those who fish. There are many other residents like me that treasure the Chesapeake Bay solely for the nature and wildlife. Thank you for your time and consideration.
Kevin Riley	Virginia	Private recreational angler		Most importantly the cap should be reviewed as soon as the VIMS study becomes available. I personally feel that the fishery should be shut down in the bay as it is in other states.
David H Gottfried	Virginia	Private recreational angler		My experience as a recreational angler tells me we need to do something drastic and urgent. There are fewer and fewer large fish in the Potomac and its tributaries along the Northern Neck of Virginia. I've also observed that the osprey nests are going empty with greater frequency. It's time to take urgent and meaningful action to save this precious body of water. Cut the menhaden catch by at least 30 percent and observe the results. We can adjust from there.
Russell Wilbourn	Virginia	Private recreational angler		My personal feeling is that there should be rules about what products can be produced with menhaden. Manufacturing cat food and agricultural products like fertilizer and chicken feed should be toghtly controlled or evev banned.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
James N Hendrickson	Virginia	Other (please specify)	Northumberl and County resident, retired military, tax payer	My preference was not an option, increase the cap limit. Since 2006 the cap has been reduced to learn the impact on the health of the bay. The evidence is now clear, the menhaden population is healthy. The cap should be raised. The counties impacted by the reduced cap limit have been economically harmed for the past 20 years as a result of this cap limit experiment. We are all glad we have the results but it now seems the goal posts are being moved, again. Menhaden populations are healthy but now we are being asked to suffer more cap limits and more economic damage. The science and data do not match the actions of this committee. Ocean Harvesters has business obligations and if they cannot meet them they will have no option but to close. This community has been patient and understanding of the past cap efforts, however, enough is enough. Time to back off, follow your own current data, wait until the Virginia funded menhaden study is complete and then consider those results but for now lets let the region recover economically and leave the cap limits alone of lift the cap. We have enough economic headwinds as it is, we do not need to pile this optional economic hardship on an already hard hit region. Thank you for leaving the cap alone or raising it.
Sue Anderson	Virginia	Concerned stakeholder		my primary interest is to reduce the harm to osprey population.
Matt	Virginia	Private recreational angler		N/A
Sam McAdoo	Virginia	Private recreational angler		Na
Tom Endrusick	Virginia	Concerned stakeholder		Need additional limits on dragging the sea floor for other harvests.
Kathryn	Virginia	Other (please specify)	Resident of the bay	No

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Timshel Purdum	Virginia	Concerned stakeholder		No
Roberto Gaylord Lovick	Virginia	Other (please specify)	Norfolk enviormental Office	No
Amanda	Virginia	Concerned stakeholder		No
Michael Wills	Virginia	Private recreational angler		No
William Brown	Virginia	Private recreational angler		No under quotas should be able to be made up at all. You don't make your quota at any interval and you lose it. Any overages should cost the company 10x actual cost. Not minus expenses.
Rick Schwartz	Virginia	Private recreational angler		None
Gindy Feeser	Virginia	Private recreational angler		None
JAMIE D FERGUSON	Virginia	Private recreational angler		None
Kelsey Steffen	Virginia	Private recreational angler		None
Robert Hughes	Virginia	Private recreational angler		None of this matters if it's not enforced! Currently there are no inspectors/observers on these boats.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kate Doyle Feingold	Virginia	Concerned stakeholder		Not taking action will cause significant damage to the Bay. The quota should be reduced by at least 50% and the types of fishing/harvesting should be restricted.
Carl	Virginia	Private recreational angler		Omega Protein should be banned from operating US flagged vessels when they are owned by a foreign company whose profits all go back to Canada! Make them so out into international waters. Stop foreign companies from raping the Bay!
Cathy Dixson	Virginia	Other (please specify)	Concerned citizen who will push for Omega to be shut down. They are raping our Bay.	Omega Proteins needs to be put out of business. We need to save our menhaden population now, not later. I realize that closing Omega Proteins would result in some loss of jobs for the locals but perhaps another solution could be found to re-employ those who have lost their jobs at Omega Proteins.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
John Bello	Virginia	Private recreational angler		One year ago, the Technical Committee recommended cutting the coastwide Total Allowable Catch (TAC) by 50%. The Menhaden Management Board chose to ignore this committees' analysis and recommendation and only implemented at 20% reduction in the TAC for 2026. Unfortunately, that didn't work and here we are again, one year later and now the Atlantic Menhaden Technical Committee and Stock Assessment Subcommittee on September 28 said maintaining the current quota of 186,840 metric tons has a probability of 99.5% of exceeding the fishing mortality target in every year from 2027 through 2029. In other words, it is almost a certainty the target will be exceeded. Moreover, reducing the TAC to 114,200 metric tons, which would represent a 39% reduction, only has a 50% probability of staying under the target. The Management Board can longer continue to kick the can down the road on this TAC. The time to take significant and meaningful action is now. Accordingly, I strongly encourage the board to cut the coastwide TAC by 40% to 112,100 metric tons for the years 2027 and 2028. This will still result in only a 40% - 50% chance of overharvest during these years. Additionally, Set the Chesapeake Bay Reduction Fishery Cap at 25,500 Metric Tons. This is roughly 23% of the TAC and in line with what the harvest has been since 2018. I am cognizant these actions are harsh, but the current and recent year's harvest trend dictate the need for drastic management action.
Mike	Virginia	For-hire vessel owner/operator/crew		Osprey are suffering breeding deficits worse than the peak of DDT. That is a huge red flag that cannot be kicked down the road. Reduction of the menhaden catch in the Chesapeake Bay must occur and drastic reductions at the least should happen.
Janet Paisley	Virginia	Other (please specify)	Proponent of Osprey Conservation	Osprey had a dismal year with many starved chicks.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kathleen O'Kane Kreutzer	Virginia	Concerned stakeholder		Other fishing communities have worked this out to support both wildlife and the fishing industry. I hope that in Virginia we can show the same level of leadership and foresight.
Will truslow	Virginia	Private recreational angler		Our family home is located in Mathews Virginia along the shore of Bavon beach, the bay has changed for the worse in recent years…menhaden are harder to come by for bait each year here with that follows the game fish …we now have to run across the bay to Cape Charles to make it worth a day of fishing with such a depletion of baitfish on the western side. As an outdoor enthusiast and avid recreational fisherman on the Chesapeake bay i urge the board to please reduce the total bay cap harvest of the Atlantic menhaden inside the Chesapeake bay. Thank you . William Truslow
Angier Brock	Virginia	Other (please specify)	I am a Master Naturalist and recreational birder.	Our local Osprey desperately need the mehaden. Please protect it against overfishing so that the Osprey can thrive and the ecosystem be kept as healthy as possible.
Tom Carricato	Virginia	Private recreational angler		Overfishing menhaden is killing the bay. Any one who is on the water is painfully aware of it. Cut the quota 50% every year until stocks come back in numbers. The quota should be revisited every year.
Jason Shepko	Virginia	Private recreational angler		Phase out reduction fishing in the bay until the population of all native fish species returns to plentiful levels.
Shaun Whitworth	Virginia	Private recreational angler		Please allow the Virginia voters to take this issue to the polls. There is significantly more upside for Virginia's residents from protection of the resource vs allowing a foreign owned business to profiteer from it with very little return realized by the state.
Lisa Cannon	Virginia	Concerned stakeholder		Please balance business needs with environmental stewardship.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Maryann Laughton	Virginia	Other (please specify)	concerned citizen supportive of our birds, in this case, Osprey	Please ban menhaden overfishing to support the Ospreys and other wildlife in the Chesapeake Bay. Thank you.
Gail Kynett	Virginia	Concerned stakeholder		Please consider the enormous impact of overfishing on our lives, not just jobs for some but the health of millions over time.
Thomas Gibson	Virginia	Concerned stakeholder		Please do the right thing here by taking action to reduce the overharvesting of menhaden. Studies do not need to prove what is obvious to everyone - our wildlife depend on menhaden for food. We are overfishing this valuable resource.
Ronald White	Virginia	Private recreational angler		Please establish a limit to the amount of menhaden being taken from the Bay. The industrial fishing is destroying the entire Bay ecosystem!
elaine watkins	Virginia			please limit menhaden fishing in the chesapeake bay. Virginia is one of very few who allow this.
Kierston Bell	Virginia	Other (please specify)	Citizen of Northumberl and County	Please note the comments presented at the Northumberland County public hearing.
Diane E Bowden	Virginia	Concerned stakeholder		Please protect our CB ecosystem.
Lee Cooper	Virginia	Concerned stakeholder		Please protect the Osprey. Would you like to have your babies starve to death?
Darby Groff	Virginia	Private recreational angler		Please put a stop to this madness! I have witnessed the boats firsthand literally stripping entire areas of menhaden, one at a time. As a Bay fisherman for over forty years, there is no doubt in the declines of normally healthy native species.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Brian McAvoy	Virginia	Private recreational angler		Please save our fishery in the middle Chesapeake Bay. I have witnessed the steady decline. I would like to see non- corporate funded impartial research begin. This issue is too important to ignore. Thank you
Patricia VonOhlen	Virginia	Concerned stakeholder		Please save the bay by drastically reducing the allowable catch of menhaden. Like to so many things in the our eco-system it's all connected. Take out too many fish then the osprey and striped bass suffer.
Bob sinclair	Virginia	Private recreational angler		Please save the menhaden for the health of the bay. Maybe the striped bass would come back to Virginia waters if so!
Karen hoffman	Virginia	Other (please specify)	Bird lover	Please save the ospreys.
Doug Hamann	Virginia	Private recreational angler		Please significantly lower the coastal Total Allowable Catch (TAC) to a level that ensures that striped bass can rebuild quickly and so that the coastal ecosystem has a abundance of bunker for all creatures to thrive
Deborah Schroeder	Virginia	Other (please specify)	Wildlife enthusiast and conservation ist	Please take action to reduce the menhaden harvest in our Chesapeake Bay. Our wildlife depend on these nutritious fish. And a healthy wildlife population (birds, fish, etc) is of benefit to all os us.
Golda Carrico	Virginia	Concerned stakeholder		Please, protect our environment by protecting the fish!
Pierre Guariglia	Virginia	Concerned stakeholder		Protect the fish so we all can benefit from what they provide for the entire east coast
James R Kortze	Virginia	Private recreational angler		Reduction fishing in the bay should be banned. Absent that, it needs to be limited as much as possible.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Brendan McGee	Virginia	Private recreational angler		Revisit the Cap annually.
Sharon Dequaine	Virginia	Other (please specify)	Concerned resident	Save our Bay! Save our Osprey!
Brandon Goodrich	Virginia	Private recreational angler		Save our fish!
sean savage	Virginia	Private recreational angler		Save the animals. Save the Bay.
Zack Truslow	Virginia	Private recreational angler		Save the bay while we can! Reduce 50% total catch limit.
DJ Yee	Virginia	Concerned stakeholder		Save the ospreys. The overfishing by commercial fishing company is unacceptable. I support the welfare of wildlife especially the ospreys!
Megan	Virginia	Private recreational angler		Screw omega
Frederick Benson	Virginia	Private recreational angler		Serious reduction of the Menhaden harvest in the Bay are long overdue!
William Disney	Virginia	Private recreational angler		Shut it down 100% for two years and see how the menhaden fishery recovers. Also you have to be a lawyer to understand how to answer some of these questions. Shut the menhaden fishing in the bay now before it's to late.
Renee Banks	Virginia	Private recreational angler		Something must be done to insure that ospreys are not driven to extinction!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Gerald	Virginia	Private recreational angler		Stop commercial harvesting for 10 years to correct the over fishing of menhaden It is at the point now that they are having trouble catching menhaden. The little fish they are catching now 4" to 6" are this year's hatching. It soon won't be financially feasible to fish for them. The BAY will be dead saidly
Arthur Miles	Virginia	Private recreational angler		Stop menhaden fishing by Omega in Virginia. Let them fish in the ocean.
Edward	Virginia	Private recreational angler		STOP Menhaden reduction fishing in the bay now!!! It may already be too late.
A	Virginia	Other (please specify)	I feel very strongly about the menhaden destroying our osprey population	stop the greed. protect our ospreys
Andrew Clay	Virginia	Private recreational angler		Stop the menhaden harvest for 2 years and then see if other fish return
Kevin Smith	Virginia	Private recreational angler		Stripers, Gray Trout, Blue Fish, Osprey and other predators rely on Menhaden to thrive. The decline of the above species are a clear sign that Menhaden are overfished in the Chesapeake Bay

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Anneke DeLuycker	Virginia	Concerned stakeholder		Subject: Public Comment on Atlantic Menhaden Draft Addendum II Dear Atlantic States Marine Fisheries Commission (ASMFC), I am writing today as a dedicated wildlife advocate and resident to express my strong support for the most protective management measures under Draft Addendum II. Specifically, I urge the Commission to select Option B4 to implement a 50% reduction in the Chesapeake Bay reduction fishery cap, lowering it to 25,500 metric tons. I also fully support establishing seasonal quota periods to eliminate the severe, concentrated industrial harvest that occurs during critical wildlife breeding seasons. Atlantic menhaden are the foundational fuel for the Chesapeake Bay ecosystem. Our local wildlife is currently sending us an unambiguous warning sign that the current cap is unsustainably high. Forage depletion has led to an unprecedented ecological crisis for local predators. Recent research from the 2026 nesting season shows that osprey reproduction rates have plummeted to near-zero levels in many parts of the Bay, with widespread chick starvation directly linked to a lack of menhaden. Other species such as bald eagles, loons, gannets, whales, and dolphins all depend on robust menhaden schools to thrive. Allowing a single industrial entity to extract over 100 million pounds of these essential fish annually from a concentrated nursery area like the Chesapeake Bay undermines ecosystem-based fisheries management. To protect the food web that sustains the Bay's incredible biodiversity, please pass the 50% cap reduction (Option B4) and mandate strict seasonal quota splitting to distribute and minimize localized depletion. I am a professor of Conservation Biology and have a direct connection to showcasing osprey to my students, and have noticed a considerable reduction in osprey nest success, hatchling deaths (due to starvation), and overall decline in osprey adult presence in the Jug Bay Preserve (MD) over the years. There is scientific evidence that directly tie menhaden decline with osprey decline. Thank you for your time and your dedication to protecting our shared marine resources. Sincerely, Anneke DeLuycker, Front Royal, Virginia

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Thomas W. Powell	Virginia	Private recreational angler		Support kicking Omega out the Chesapeake Bay entirely but this is a start.
James Davis	Virginia	Private recreational angler		Thank you for considering my opinion
Emily Landon Davies	Virginia	Concerned stakeholder		Thank you for doing an honest and transparent job of protecting our Bay ecology.
Anton Sorkin	Virginia	Private recreational angler		Thank you for listening ASMFC. Time to act!
Andrew Tonra	Virginia	Private recreational angler		Thank you for opening this up for public comment and providing this survey
Kristin Giordano	Virginia	Concerned stakeholder		Thank you for the opportunity to weigh in and support this important work! The decision that you are making impacts the possibility for future commerce in the Chesapeake, tourism dollars, recreational anglers, and all of us who live, work, and recreate in the Bay. Thank you for thinking about the future of our community in 3, 10, 20, and 50 years as you make these decisions. These decisions affect all of us and can ensure that we protect some of our most vital resources before we lose them forever.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
A. M. Lindemann	Virginia	Concerned stakeholder		regulation of menhaden fishing and menhaden sustainability in the Chesapeake Bay region of Virginia; I am sincerely appreciative. I am both Virginia native and resident in the Chesapeake Bay region. In my younger years, I sailed competitively up and down the Chesapeake Bay. As an adult, I have variously been an award-winning NASA research engineer, turned award-winning economic development leader across several Mid-Atlantic states, now entrepreneur. I also currently serve on a local wetlands board, as well as the board of a statewide conservation nonprofit. Throughout, I have loved and long enjoyed the bounty that is our State: the waters; the land; the citizenry; the wildlife. I assert that, in the Chesapeake Bay region, menhaden fish are over-fished, and that the problem is a very serious if not dire one. I also take the position that commercial fishing of menhaden regionally must be significantly limited, if not eliminated altogether. I base those assertions on myriad scientific reports – through the last 10, 5, and even more recent years, as well as multi-year personal observation – that convincingly point to this unwelcome conclusion. Parallel findings of dangerously reduced or compromised populations of both marine and avian species that are vitally dependent on menhaden in the Chesapeake Bay for their survival are red flags that must not be ignored any longer. Anecdotally and very personally, from my own careful observations through the last almost 15 years in the area where I live in Hampton Roads at the mouth of the Elizabeth River, the exclusively menhaden-dependent Osprey population – thriving more than a decade ago – has crashed. Back then, I used to be able to regularly take pictures of the numerous successful nesting pairs in my immediate surroundings, along with Ospreys living on my own property. Frequently at that time I could witness and photograph upwards of 20 Ospreys at a time hunting over the river, however such a scene has in the interim disappeared from the scene. By 2018, the one remaining nest of the year in my environs failed. By 2022, I almost never saw an Osprey with a menhaden catch. By late April 2023, there were no Ospreys in the area, which meant no nests that year or in all the years since, either – a true documentable tragedy, but one completely preventable and also correctable provided the needed Menhaden protections are put into place. It is an undeniable red flag that all states but Virginia have enacted

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Mary McLean	Virginia	Concerned stakeholder		Thank you for your careful considerations of these choices weighing in with those who have the most to lose.- For the Ospreys - their lives.
Stephanie Lessard-Pilon	Virginia	Concerned stakeholder		Thank you for your consideration of this important species and fishery!
Danny Pettengill	Virginia	Concerned stakeholder		Thanks for allowing our input. Menhaden need protection from overfishing by out of state/country interests. The osprey decline is linked. Thanks for considering action to protect our wildlife and fisheries.
Shawn Maxwell	Virginia	Private recreational angler		The Bay and surrounding rivers have been a longstanding pastime for our family for years! Doing anything and everything to ensure its health is not only desirable but necessary for future generations.
KEN KLOTZ	Virginia	Private recreational angler		The Bay Cap may be revisited more frequently than every 3 years, and probably should be considering the condition of the menhaden population at this time, but at least with a 3 year schedule it wouldn't be more than 3 years..
James Clay	Virginia	Private recreational angler		The bay is almost dead for the recreational fishermen I would like to see it come back
Kent	Virginia	Private recreational angler		The bay quarter needs to be reduced to for Omega protein
Pippa Holloway	Virginia	Concerned stakeholder		The Chesapeake bay is a treasure. Please protect our ecosystem.
Caroline Coe	Virginia	Concerned stakeholder		The Chesapeake Bay is an invaluable resource nationally, regionally and as part of my personal heritage. The health of the BAY as a total system must be sustained.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Scott Wiley	Virginia	Private recreational angler		The Chesapeake Bay is the most important nursery and feeding ground on the Atlantic Coast, and menhaden are one of the most important species in that ecosystem. They feed striped bass, ospreys, dolphins, and countless other predators. The reduction fishery removes millions of pounds of these forage fish from the Bay to be processed into fishmeal and fish oil with no tangible penalty or repercussions for overfishing quotas. While the overall Atlantic stock may still be considered healthy, that does not tell us whether enough menhaden remain in Chesapeake Bay waters to support the ecosystem that depends on them. The Bay should be managed as an ecosystem, not as a source of raw material for industrial processing. We have invested decades and billions of dollars into restoring the Chesapeake Bay. Protecting the forage base that supports striped bass, ospreys, and other wildlife should be a fundamental part of that effort. I urge the Commission to eliminate the Chesapeake Bay reduction fishery and leave more menhaden in the water where they belong. If a reduction to the cap is approved, it is a step in the right direction, but we must do more to place heavy fines, and devastating consequences to those who overfish this cap and exceed quotas.
Wayne Young	Virginia	Private recreational angler		The Commonwealth of Virginia has consistently placed the interests of the menhaden reduction fishery above conservation of the species fin the Chesapeake Bay and its approaches in Virginia coastal waters for the benefit of predators that rely on menhaden for forage and the public interest. The Commonwealth has yet again failed to fund essential studies needed to support well-informed fisheries management determinations. Unfortunately, the politicians and the reduction fishery interests don't want the answers to the questions that the planned studies would produce. Therefore, the ASMFC is encouraged to continue its proactive efforts to conserve menhaden in the Chesapeake Bay which is critically important not only to the menhaden as a nursery but also as a forage species for important sportfish and the associated sportfishing and commercial fishing sectors which rely on them. The boundary for Chesapeake Bay menhaden fisheries management should also include a buffer in coastal waters around the entrance so that the Bay quota isn't compromised by concentrated reduction fishery harvest effort in menhaden migration paths in and out of the Bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Brett Jones	Virginia	Private recreational angler		The current menhaden capture is decimating the Bay. We have seen Osprey numbers plummet in recent years- this requires massive intervention.
Lindsay Bomgardner	Virginia	Concerned stakeholder		The current rate of harvest of Atlantic Menhaden in the Chesapeake Bay is not sustainable nor proportionate to broader Atlantic harvest. The harvest rates in recent years are incredibly concerning for the success of the Chesapeake Bay fish. Despite not having an in depth and focused study, it is evident that the number of Menhaden in the Chesapeake has greatly decreased in recent years, which should result in a decrease in fishing pressure as well as the improvement of fisheries independent surveys within the region. The limited scope of focused research on the species leads to inaccurate assumptions of the appropriate harvest levels, so more work needs to be done to ensure that this fishery is able to continue in the future and balance is able to return to the system. Menhaden support many other recreationally and commercially important fish as well as birds and other wildlife. They are an essential part of the Chesapeake Bay ecosystem and provide many people with their livelihood. Without proper management and harvest limitation on the species, their chance of success is greatly reduced. Creating an appropriate limit based on research and the current state of the fishery is the only way to ensure that they will remain stable and healthy.
Michael H Freeman	Virginia	Private recreational angler		The current status quo has decimated the fishery. The osprey aren't reproducing and the catch amounts have dropped precipitously year over year since the omega plant increased its catch volumes in the mouth of the Rappahannock. This has had devastating effects on the tourism/recreational fishing industry around here.
T van	Virginia	Private recreational angler		The damage to the environment due to overfishing on the bay is obvious. Normal fishstocks are decreasing due to the lack of bunker to include rockfish and cobia. The osprey have not returned in the same numbers the past 10 years also due the over fishing in the bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kevin Howe	Virginia	Other (please specify)	Retired Ichthyologist & Researcher	The ecosystem needs help and menhaden are a keystone system to this ecosystem. The decline of baitfish and the declines in sportfish are bioindicators. Further the precipitous decline in Osprey young survival is due to research indicating the delivery of menhaden to the nest has been reduced as much as 80%. While some say Menhaden are abundant, yes, they are to the reduction fishery but not to the ecosystem itself. This has become painfully clear. While I feel sad in regard to the Menhaden commercial fishing personnel, history shows a crash is likely in the near future - a crash from which the ecosystem may not recover.
Craig Freeman	Virginia	For-hire vessel owner/operator/crew		The full 50% reduction should be given to the reduction fishery. This would be ideal as Virginia just funded the study of Manhattan in the Chesapeake Bay and we need to have time to make the study work. If I reducing the cap, it will ensure there are menhaden to study.
Rosanne Lush	Virginia	Private recreational angler		The impact of fishing on Osprey and other birds of prey is vitally important. We should take whatever measure necessary to ensure they are not fished out of existence. Once they are gone, they can never come back. Please protect our most precious natural resources, including the animals who rely on us to respect nature's balance.
Julie V. Kacmarcik	Virginia	Other (please specify)	Conservation Chair Richmond Audubon	The menhaden are a public resource that provide for the complex ecosystem of the Chesapeake Bay. Time is up. The harvest of the most important forage fish in the ocean/bay is risking the sustainability of many species. Because it is now vividly seen in the collapse of osprey populations throughout many portions of the Chesapeake Bay must tell us that something is also going on below the surface disrupting the balance of this vital ecosystem. The decision to stop this overharvesting of menhaden is not a personal attack at an industry. It is a decision to do the right thing to protect our fish, our Bay and all that it is. Because something is a tradition, does not in itself mean it is the right thing.
Joan Keith	Virginia	Concerned stakeholder		The menhaden are overfished and causing great harm to the ecosystem, in particular for the osprey whose numbers are in sharp decline in the Chesapeake Bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Katy Marchello	Virginia	Other (please specify)	consumer and a part of wildlife and nature conservation	The menhaden are overfished and causing great harm to the ecosystem, in particular for the osprey whose numbers are in sharp decline in the Chesapeake Bay. Virginia is the only Atlantic coast state that allows industrial-scale trawling for menhaden.
Elisabeth Brisebois	Virginia	Other (please specify)	I believe it should not be fished at all and left for osprey birds.	The menhaden fish should be completely and totally left to the birds. They were here first and should not have to starve and starve their chicks.
Dave Nolan	Virginia	Private recreational angler		The menhaden harvest in the bay is adversely affecting many species. Menhaden harvesting should be moved out of the bay and in to the ocean.
Erik Harwell	Virginia	Private recreational angler		The menhaden industry has been paying off state level politicians for years. The current harvest rate and associated by catch is unsustainable. An overabundance of menhaden would be far more beneficial than the small schools that remain. I have spent many thousands of ours on the bay and its tributaries, the decline has been drastic. Sewage dumping and lawn fertilizer run off are also major contributing factors but of all the primary issues facing the bay, a significant reduction in the menhaden harvest is the easiest and quickest to implement
Gabriel Joseph shen	Virginia	Private recreational angler		The menhaden is too much of an important resource to the bay to allow over harvest

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Andrea Steegmayer	Virginia	Other (please specify)	Resident	The Menhaden issue has been around for a long time and the board has continued to decline to act to protect our resources. This is not acceptable. Wildlife and people depend on it. Other states have long provided caps. The collapse of the Hering industry should be a warning. The ocean is not an unlimited resource for us to squander or to provide profits for a Canadian company. The folks in Reedville could be out of jobs before long once the resource is decimated-and then what?
Susan Mastyl	Virginia	Concerned stakeholder		The menhaden population in the Bay is critical to many other species -- ospreys, striped bass, blue crab, and others -- as well as many fishing, tourism, and recreational operations. It is critical that we manage this resource conservatively -- a population crash of this forage fish would have devastating and permanent consequences.
Tyla Matteson	Virginia	Concerned stakeholder		The menhaden populations must be allowed to recover. If these options do not work for recovery, a full moratorium must be established. The state of Virginia should not be exempted.
Judy Jones	Virginia	Other (please specify)	a lover of birds and a protector of the environment	The menhaden quota should be reduced because the current level of harvest is placing real stress on the coastal food web, especially for species like Osprey that rely on menhaden as their primary prey during nesting season. When menhaden numbers drop, Osprey struggle to feed their young, leading to lower fledging success and weakened populations. The same ripple effects extend to other predators—bald eagles, herons, striped bass, marine mammals—whose health and stability depend on abundant forage fish. Protecting menhaden is not just about a single species; it is about safeguarding the ecological foundation that supports the entire Chesapeake Bay and Atlantic coastal ecosystem. Reducing quotas now is a necessary step to relieve that pressure and allow these interconnected species to recover.
Paul Heinold	Virginia	Private recreational angler		The number of menhaden in my home fishery, the tidal Potomac River, has visibly and drastically decreased in the past several years and appears to be impacting the health of the striped bass in the system, which are also in trouble due to poor spawns. Stop these foreign companies from wrecking these resources for fish oil pills that don't work and for pet food that can be made from much more sustainable sources.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Greg Barlage	Virginia	Shore-side support industry (e.g., bait and tackle shop owner, boat retailer)		The reduction fishery industry has been operating for nearly 150 years. It provides income for many families and businesses in the Northern Neck of Virginia and beyond. My company is located in Richmond and is a substantial part of our business supporting the families of our employees. I have worked in the industry since 2015 and know many of the managers and operators at the Omega Protein facility. They all are very respective of the fish population because they know if overfishing occurs their livlie hoods will go away. The studies I have reviewed on this matter do not seem based in science but in hearsay and what people believe they are observing. I do not think it is prudent to destroy an industry over what some people "feel" is happening it should be based in science. Therefore, I would like to see no change to the current harvest rates, and at some point if the science proves it, the fish quota may need to be increased. I appreciate your attention to this matter. Sincerley Greg Barlage President Process Design and Service
Russell Haynie	Virginia	Concerned stakeholder		The science does not support reducing the Bay quota at this time.
Andrew D McCoy	Virginia	Concerned stakeholder		The status quo has not been working. It is exhausting this resource and needs to be reduced.
Steve	Virginia	Private recreational angler		There are no longer enough menhaden in the bay to support both the ecosystem and a large scale industrial fishery. thank you for taking action on this despite what the industry claims, there will be little or no impact on their work force as a result of this addendum. They will simply fish more in the bay as they did in several of the years in the past decade.
Matt Marlowe	Virginia	Private recreational angler		There shouldn’t be any commercial menhaden harvest allowed at all in the Ches Bay. None.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
wayne keith boyd	Virginia	Private recreational angler		These are extremly complicated questions. My desire is to reduce the menhaden catch as much as possible. I sold my boat in deltaville and am moving to NC because the fishing has gone to crap in the Bay. How can we expect populations to rebound when we continue the wholesale harvest of the foundation forage species. I suspect many species are now eating their young instead of menhaden. Its truly sad that we even have to conduct a survey like this. You know Omeaga employees are getting all their families to respond.
Mark Barnes	Virginia	Private recreational angler		These companies are over harvesting the fish in the bay, and it is destroying the environment of the bay by removing feeder fish for the entire ecological system.
Aylett Lipford	Virginia	Concerned stakeholder		These fish are the bottom of the food chain of all life in the bay, we need to protect them!
James ward	Virginia	Private recreational angler		These measures are better than what has been. However, I believe we should not allow menhaden fishing inside the bay. I have fished the bay for 36 years since I was 16 and have watched the menhaden population decline over that time. The last 4 years have been devastating to the bay. Menhaden schools are harder to find in the bay than they ever have been. I think even the menhaden fisherman would agree. This is affecting the whole ecosystem and we will lose this national treasure of the Chesapeake Bay if something is not done
Capt James Darby Wootten Se	Virginia	For-hire vessel owner/operator/crew		They are actively destroying the bay I see starving ospreys every single day.
joseph anniello	Virginia	Private recreational angler		they should measure and revisit on an ongoing basis.
Justin Dooley	Virginia	Private recreational angler		This action is at least 20 years late.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Selim Kahveci	Virginia	Private recreational angler		This affects so much of who we are, please do the right thing.
Dominic smyth	Virginia	Private recreational angler		This bay as everyone knows supports more than just omega protein… it supports every Capt. every guide, every bait shop, every subsequent linked business, hotels, boat sales, Realestate, property values, it is the backbone of the entire region and beyond. Maintaining a healthy fishery is that important to the entire region… now think of how important it is to the entire Atlantic Ocean… it's the backbone of the entire eastern seaboard… I've fished this bay my whole life now. And like everyone else here I've seen the decline. The flounder and striper first…. Now the large Cobia numbers are falling, soon the red drum that are abundant will also decline if we do not stop destroying the one baitfish that supports every single one of us and our families directly or indirectly. Restrict and restrain these boats harvesting menhaden so that hopefully our grandkids can enjoy this resource instead of a handful of employees at a protein company.
Marsha Stonehill	Virginia	Shore-side support industry (e.g., bait and tackle shop owner, boat retailer)		This fishey needs to be BANNED from State waters
Frank Bentz Jr.	Virginia	Private recreational angler		This has been an ongoing issue for years, please address the over fishing with the passing of this addendum.
Jimmy	Virginia	Private recreational angler		This is a start, but they should ban commercial menhaden fishing from the bay.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Tomoko Hamada	Virginia	Other (please specify)	Osprey watcher	This is a very slow but first step. ASMFC should have a moratorium or 100% stop of industrial reduction fishing.
Glenn H Russell	Virginia	Private recreational angler		this is an urgent issue.
Jessica York	Virginia	Concerned stakeholder		This species is the basis of the food chain for everything in the bay and we need to protect it!!
Teresa Hall	Virginia	Concerned stakeholder		Three years is too long, it should be revisited annually. Overfishing is killing the entire bay!
John	Virginia	Private recreational angler		Time has come for the board to make changes for the future of the bay,and the next generation.please do make changes our children deserve a healthy bay not a water dessert!!

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Anthony Quintero	Virginia	Private recreational angler		resident of Gloucester, Virginia, and an avid recreational fisherman who spends countless hours on the Chesapeake Bay. I regularly fish the Piankatank River, Rappahannock River, Mobjack Bay, and Lower Chesapeake Bay aboard my boat, PanaSea Ya. Fishing is more than a hobby to me. It is something I share with my father, my son, my wife, and my family. It is a tradition I hope future generations will have the opportunity to enjoy. I am writing to strongly support the strictest possible conservation measures for Atlantic menhaden in the Chesapeake Bay. Menhaden are not simply another commercial fish species. They are a critical part of the Chesapeake Bay food web, supporting striped bass, bluefish, ospreys, and numerous other predators. When we remove enormous quantities of these forage fish from an already stressed ecosystem, we risk affecting far more than one species. I have spent enough time fishing these waters to understand the importance of baitfish, feeding birds, and healthy predator populations. I have watched birds dive on schools of bait and searched for the fish feeding beneath them. Those experiences reinforce how closely connected the Bay's wildlife really is. We cannot continue treating the Chesapeake Bay as an unlimited source of industrial fish harvest. I respectfully urge the Commission to adopt the strongest available protections under Draft Addendum II: Implement the maximum 50% reduction in the Chesapeake Bay industrial reduction fishery cap, lowering it to 25,500 metric tons under Option B4. If the Commission instead links the cap to the coastwide quota, I support the most restrictive proposed percentage, 13.6%, without a minimum harvest guarantee. Establish strict seasonal harvest limits, including Option B2, which limits the first two fishing periods to 25% of the annual cap each. Concentrated industrial harvesting during critical spring and summer feeding periods must be restricted. Require strict accountability and enforcement. Quota overages must be deducted from future allocations, reported harvests must be independently verified, and fishing must stop when limits are reached. Unused quotas should never accumulate into additional harvest allowances in future years. Require regular scientific reviews at least every three years, with immediate reconsideration when credible evidence indicates the need for stronger protections. Pursue additional regulations to prohibit industrial reduction purse-seine fishing within the Chesapeake Bay, particularly

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert J Schepker	Virginia	Private recreational angler		To: Atlantic States Marine Fisheries Commission & Virginia Marine Resources CommissionRe: Public Comment on Atlantic Menhaden Draft Addendum IITo the Members of the Commission,My name is Robert J. Schepker, and I am a resident of Henrico County, Virginia (ZIP code 23233). I am writing to formally submit my public comment regarding Atlantic Menhaden Draft Addendum II. I strongly urge both the VMRC and the ASMFC to adopt the strict management options being proposed that would reduce the industrial Chesapeake Bay menhaden harvest cap by up to 50%.Atlantic menhaden are a vital keystone species that underpin the entire ecological health of the Chesapeake Bay. They serve as an irreplaceable primary food source for economically and ecologically important sport fish like striped bass, as well as a wide array of marine mammals and predatory birds.Allowing massive, industrial-scale "reduction fishing" to continue removing hundreds of millions of pounds of menhaden from the Bay each year causes localized depletion. This depletion creates severe ecological imbalances that directly harm our local tourism, coastal business owners, recreational anglers, and marine ecosystems.As a Virginian who is deeply invested in the long-term health of our natural resources, I ask that the Commission prioritize robust, science-based conservation over short-term industrial harvesting interests. Implementing a 50% reduction to the Chesapeake Bay harvest cap is a critical and necessary step toward restoring and protecting the Bay for generations to come.Thank you for your time, your consideration, and your commitment to safeguarding our public waters.Sincerely,Robert J. Schepker2406 Cedar Cone DrHenrico, VA 23233bschepker@mcmhomes.com
Gary Lowe	Virginia	Private recreational angler		Total ban on this menhaden fishery. Like all the other sensible states. 3 mile limit should be normal for foreign entities. The whole fishery is in danger.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Robert Shepherd	Virginia	Private recreational angler		Virginia has proven to be a very poor steward of God's resources. All the living creatures that are dependent upon menhaden as a food source are declining, yet, despite the decreased natural predation, the number of menhaden keep declining. Virginia commercial fishing policies is an embarrassment to most of the free world. The obvious over fishing of menhaden (along with continuing to allow the archaic and indiscriminate killing of fish via gill nets) are two of the biggest embarrassments. The only success story Virginia fish management can claim is the rebound of striped bass after numbers were so decimated in the 80's that they put in place a total moratorium. Not surprisingly, the numbers of striped bass bounced back quickly and also not surprisingly, Virginia once again allowed overfishing and depleted the striped bass population again in just a few years. Put greed and politics aside and do the RIGHT thing!!!!
Kevin Pauley	Virginia	Private recreational angler		Virginia should follow the lead of all other eastern seaboard states and move reduction fishing to federal waters.
WILLIAM RAY BLACKMAN	Virginia	Private recreational angler		Virginia should not account for 75 percent of the harvest!!!
Jackie Nunnery	Virginia	Concerned stakeholder		Wait until studies are completed. Be guided by science, not feels
Caroline Raymond	Virginia	Other (please specify)	Concerned private citizen and birdwatcher	We absolutely have to support the ban on over fishing for menhaden. This fish is not essential for humans, but IS essential for the birds, as well as the sea creatures, of the Chesapeake Bay. We humans are a particularly destructive force to nature and there needs to be significant course correction. If the Bay suffers, so do we all. As a result of the industrial overfishing of the menhaden population, the Bay ecosystem is in serious trouble. At this point, it is CRITICAL to take drastic measures to protect it before it is too late and the damage is irreversible.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Mark Christopher Stromdahl	Virginia	Private recreational angler		We have been fishing in the VA bay for 20 years and have experienced drastic decline in pan and sportsfish populations.
Liz Povar	Virginia	Concerned stakeholder		We have lived at the confluence of the Rappahannock River and Chesapeake Bay for over 10 years. As a recreational boater and waterfront homeowner, I can state factually that the number of osprey visibly nesting has decreased each year, and in 2026 we saw 0 nests or young osprey. We do, however, see the menhaden fishing boats consistently plying the waters. We believe there is a correlation between the commercial fishing and the number of osprey nesting; the commercial fishing is negatively impacting the food source for the osprey. We encourage tighter restrictions on the commercial menhaden fishing industry.
Suzanne Gallagher	Virginia	Other (please specify)	A homeowner who lives on the Rappahannock River	We live in Middlesex County Virginia--on the Rappahannock River in sight of the mouth of the Chesapeake Bay. When we bought our house in 2008 we were captivated by the wildlife--especially the osprey. We learned their schedule--when they left in the fall and returned in the spring--to the same nest. We watched them catch fish, fly around until the fish was dead and then sit on a branch in a tree in our yard and eat that fish--or take fish to the nest to feed their babies. This was endlessly interesting. Watching them cover the naked babies with their wings when the sun was beating down. For the last two years we've seen very few osprey flying around--and none sitting in the tree in our yard. Our neighbor who was a charterboat captain has given up that work--not enough fish. People can't catch enough menhaden to bait their crab pots. Something is happening to the health of our river. The food chain is being affected in ways we can see and likely others which we cannot see. We think the cause of the problem is that menhaden are being overfished by the commercial fisheries. We are losing the fish in our river and bay so they can be swallowed up to make cat food and fish oil. Let them fish in the Atlantic--not in the Chesapeake Bay. We hope you will help us save our river. What is being done now is not working. Insanity is doing the same thing and expecting it to go differently.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Joan Podd	Virginia	Private recreational angler		We live on the bay. In previous years we frequently caught several game fish off our dock every evening. This year we went weeks without catching even a tiny spot. The bait fish that used to be around our dock are gone, the ospreys and eagles are gone. The destruction of the menhaden population have destroyed the entire ego system.
Edward Ashley	Virginia	Concerned stakeholder		We MUST protect this fishery, people don't need menhaden for pet food and fertilizer the BAY NEEDS it for all the wildlife that depends on it.
Tami L Stukey	Virginia	Concerned stakeholder		WE MUST SLOW THIS DOWN OR RISK CATASTROPHIC DAMAGE
WALTER CHILDS	Virginia	Private recreational angler		We MUST undertake maximum efforts to promote the Menhaden population.
Connor Rust	Virginia	Private recreational angler		We need to be more vigilant about protecting the bay and establishing caps / quotas to hold omega in check. Omega is destroying our fishery and this is having a profound, negative impact on striped bass, redfish, Cobia, trout, etc. as well as on osprey populations. The economic value of the bay as a natural resource and recreational area / fishery far outweighs the value of any jobs created by Omega.
Michelle Keller	Virginia	Private recreational angler		We need to defend the defenceless. The menhaden feed so many species and need to be protected
John Dyson	Virginia	Private recreational angler		We need to do these caps to bring back the Chesapeake Bay fishery. If we don't learn how to balance the harvest, there will be no industrial catch in the future either. This is very basic logic.
Sean Peucker	Virginia	Concerned stakeholder		We need to protect this essential ecosystem that stretches across a vast area, the decline in fish and bird populations is a sign of what is coming. Listen to the people who spend their time living here and enjoy the presence of these beautiful areas, flora, and fauna
Brent Neal	Virginia	Concerned stakeholder		We need to protect this extremely important resource instead of the vast over harvesting that continues to cause harm.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Ian McNair	Virginia	Private recreational angler		We need to severely limit the reduction fishery along the Atlantic Coast, primarily in the Chesapeake.
William Judge	Virginia	Concerned stakeholder		We should prioritize the Bay for local folks, not for non-USA firms to exploit our precious bay. The Bay is suffering and limiting menhaden exploitation will help the ecosystem.
Denise D.Apple	Virginia	Concerned stakeholder		We were given the beautiful bay and everything that lives in and around it. We need to be better stewards !!
Chris Anderson	Virginia	Private recreational angler		What is wrong with us? Virginia is the only Atlantic coast state that allows industrial-scale trawling for menhaden. WHY? The overfishing of menhaden is causing great harm to the ecosystem. It is causing great harm to anyone else who enjoys fishing or who fishes for a living. Osprey numbers are in sharp decline in the Chesapeake Bay. The bay is a necessary SYSTEM of interconnected life ... and a commercial enterprise shouldn't be allowed to decimate it for corporate profit.
Judson	Virginia	Private recreational angler		When I was a kid, there was a great striped bass fishery. You could go and literally fill the boat if you wanted to Today, there are no predator fish in the bay because there are no bait for them to eat We are literally raping the water, so a couple companies can turn a profit Let those people do it offshore or teach them how to farm it. There's no need to raid our natural resources
Dave Vachet	Virginia	Private recreational angler		While I understand osprey and striped bass suffer and get plenty of deserved attention, the entire ecosystem has suffered. I believe the weakfish decline is a coastal-wide ecosystem collapse indicator directly related to overfishing menhaden. We bring the rockfish back to everyone's delight, but when they couldn't find enough menhaden to eat in early autumn, they began eating all the juvenile weakfish making their first runs out. "Game" fish eating game fish (and all the crabs)? Is that really what we want? Please finally get a handle on this small number of people who over-harvests an important resource that belongs to all.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Shayne Zasimowich	Virginia	Other (please specify)	I recreational fish a majority of the time but I also maintain a valid Virginia Commercial Watermans Card.	Would be interesting to see what a reduction in the bays quota would do for the over all health of the ecosystem. Other measures need to be taken as well. Primarily concerning pollution. But those arent the concern of this body.
Pam McLeod	Virginia	Other (please specify)		Concerned citizen, Osprey supporter
Ray W. King	Virginia	Other (please specify)		Concerned citizen about the health of the Chesapeake Bay and its wildlife.
Patricia Johnson	Virginia	Other (please specify)		Person who is worried about about the ecology and food distribution to osprey and other life in and out fo the water. Menhaden or bunker are a fox for many plus bait for those that fish and crab etc
Barry Dombek	Virginia	Other (please specify)		Osprey protector, observing and recording nesting at my property

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Kyle Callahan	Washington	Concerned stakeholder		I recently traveled through the Chesapeake Bay region and learned about the negative impacts Menhaden fishing practices are having on wildlife. Specifically, American Osprey are struggling to find the fish they need to survive and raise offspring. Without a change to current fishing practices and enforcing stricter catch limits through science-backed policies, Osprey will become more scarce across the region. Already their numbers are down and the Chesapeake Bay provides a critical location along the Atlantic Flyway migratory route. Beyond these captivating birds, numerous other species also rely on healthy Menhaden populations throughout the year, but the numbers of available fish are down. I urge the Atlantic States Marine Fisheries Commission to act on these draft addendum considerations in order to maintain a sustainable supply of Menhaden across the Atlantic throughout the year, supporting all wildlife that live in and around the Chesapeake Bay. Thank you.
Kristin Johnson	Washington State	Concerned stakeholder		I recently visited the Chesapeake Bay on vacation and was informed about the dire situation of Osprey nesting failures over the summer of 2026. Even though I am a resident of Washington state, I urge the Commission to act to reduce the Bay Cap and allow for repopulation of Menhaden in the bay to support a healthy ecosystem.
Marina Drake	Wisconsin	Other (please specify)	Concerned citizen	I've selected the options above for the least fishing. I actually do not support any fishing, for the sake of the menhadens and for the reasons mentioned above. The Commission should consider the interests of all and not solely those who fish.
Nicholas WazeeGale	Wisconsin	Other (please specify)	Citizen concerned about wildlife	The decline of menhaden should be of concern to all citizens as it is affecting the viability of many species dependent on this fish. I humbly ask we more greatly limit harvests fur the sake if this fish’s numbers and all the species whom depend on them, including human harvesters.

Name	State	Participate in the Atlantic menhaden fishery?	Other (please specify)	Any additional comments you would like to provide:
Jonathan Balcombe	American citizen currently living in Canada	Other (please specify)	concerned scientist (biologist)	We humans have many food choices available to us. Marine creatures, less so. I don't believe we should be catching large numbers of Menhaden from the Chesapeake Bay.
Marian Hussenbux	Britain	Other (please specify)	animal welfare organisation	The members of Animal Interfaith Alliance in Britain have chosen these options for the least fishing possible. We wish there were no fishing at all, for the sake of the menhadens and for the reasons mentioned above. We wonder why the Commission appears not to be considering the interests of all local residents and not solely those who fish. It is surely beneficial for all - human and non-human beings - to protect a wide biodiversity in the Bay. As people of faith who try to adhere to the compassionate Jain precept of ahimsa - do no harm - we are offering a somewhat different perspective for your consideration. Thank you for this opportunity to do so.
Debra	CA	Other (please specify)	Advocate for not taking more from the ocean - overfishing	The menhaden is a keystone species - vital for other ocean animals including seabirds and whales. There should be no taking of this species at all
RE Penney	California	Other (please specify)	wildlife observer	As frequent visitors to my parents who live on the bay, (for generations), we have noticed a decline in wildlife that depend on the Menhaden. Sensible protection is now required. Sooner than later. (thank you)
Sarinea Meserkhani	California	Other (please specify)	Concerned citizen invested in habitat and biodiversity conservation	I strongly urge the board to incorporate the September 2026 by Dr. Watts into their November decisions. These findings link Osprey nest failings to Menhaden scarcity and reinforces the 50% reduction as a cautionary measure to rebuild the Chesapeake Bay Menhaden predatory fish and bird populations.
